APPENDIX E- Acronyms List	89

### 1.0 Goal Statement

The PEPFAR Lesotho's Country Operational Plan (COP) 2021 is the culmination of work from the PEPFAR Lesotho interagency team and strong collaboration with The Global Fund and the Ministry of Health. The recent LePHIA 2020 demonstrates that Lesotho has achieved the UNAIDS 90-90-90 goals with 90% of people living with HIV (PLHIV) knowing their status; 97% of those who know their status, on treatment; and 92% of those on treatment, virally suppressed. Furthermore, according to the recent UNAIDS Spectrum estimates, Lesotho has reached epidemic control – the point at which new HIV infections fall below the number of AIDS-related deaths. While we celebrate this remarkable achievement, we recognize the threat of the COVID-19 pandemic and the negative impact it has had on the HIV response in Lesotho over the past year and likely for the foreseeable future. Nevertheless, LePHIA 2020 shows what the HIV response in Lesotho, through the support of PEPFAR, is able to achieve. By protecting its gains and ensuring treatment continuity, Lesotho will be able to recover and reach the next set of milestones, the UNAIDS 95-95-95 goals. It is against this background that COP21 will focus on maintaining epidemic control through the following three objectives:

- Mitigate COVID-19 impacts on PEPFAR programs and support recovery
- Attain UNAIDS 95-95-95 goals
- Consider strategies for transition and sustainability of the Lesotho HIV response

With COVID-19 many of PEPFAR's programs were either stopped or scaled-down in order to reduce the risk of transmission and protect the safety of both PEPFAR-supported staff and beneficiaries. Recognizing that many of PEPFAR's programs are also crucial to saving lives and preventing HIV transmission, Lesotho evaluated the risks and benefits of our programs and were dialing up or down program activities as the COVID situation permitted. First and foremost, we were ensuring that our PLHIV were able to continue on their treatment by scaling up multi-month dispensing and initiating community ART delivery programs. COVID-19 will still be a reality for most of COP21 programming, and therefore, we will focus on adapting our programs as necessary and gain as much ground as possible.

In COP21, PEPFAR Lesotho will aim to reach the UNAIDS 95-95-95 goals. There are still subpopulations, such children 1-4 years old, young people, and men, who do not know their status and who are not on treatment. We will aim to target our interventions for case-identification, such as index testing and use of HIV self-testing in various modalities. To maintain at least 90% of PLHIV on ART, we will ensure continuity of treatment through client-centered services by continuing to scale up activities such as: 6-months, multi-month dispensing; decentralized drug delivery; virtual case management for tracking of those who missed appointments or have had interruptions in treatment; "return to care" package of services; and offering enrollment of 90% of children living with HIV (CLHIV) into the orphans and vulnerable children (OVC) program. A major focus in COP21 will be

pediatric treatment optimization and the transition to dolutegravir 10 mg. We will continue prevention programming for our adolescent girls and young women (AGYW) through DREAMS; wrap-around services for our OVCs; prevention programming for key populations; and maintain both voluntary medical male circumcision (VMMC) and pre-exposure prophylaxis (PrEP) programs. To decrease morbidity and mortality, we will scale up the package of services for those with advanced HIV disease; intensify TB case-identification; continue to scale up TB preventive therapy for our PLHIV; and continue cervical cancer screening and secondary prevention. Finally, we will maintain our programs for sustainable systems and invest in laboratory, health management information (i.e. eRegisters), supply chain, human resources for health, community-led monitoring, and local capacity partner building.

In COP21, Lesotho will consider strategies for transition of the PEPFAR program. In collaboration with the Government of Lesotho, Civil Society, Global Fund, and other stakeholders, we will identify the functional and financial barriers to sustainability of the HIV response. The 2021 Sustainability Index Dashboard and Responsibility Matrix will provide much-needed information to allow PEPFAR Lesotho to explore strategies to increase GOL functional and financial responsibilities and increase the role of Civil Society.

### 2.0 Epidemic, Response, and Program Context

### 2.1 Summary statistics, disease burden and country profile

Lesotho has a total population of 2,077,311 people, 51% of whom are women and 31% of whom are under the age of 15. The country is divided into ten districts, five considered highlands and five lowlands. Lesotho is classified as a lower middle-income country with a Human Development Index of 0.527<sup>2</sup> and a Gross National Income (GNI) per capita of \$3,151. Seventy-two percent of the population live in rural areas.

In 2020, the Lesotho Estimates Group determined that, due to the large number of Basotho accessing HIV services outside of Lesotho, the de facto population of 1,855,913, based on the 2016 Census, was the most appropriate for national estimates. These updated numbers have been incorporated into our population-level estimates in the UNAIDS Spectrum model along with the 2020 Lesotho Population Based HIV/AIDS Impact Assessment (LePHIA) district HIV prevalence and incidence and country 2020 program data. This model forms the basis for PEPFAR planning and is aligned with the LePHIA2020 results showing that Lesotho has achieved 90-97-92 for those 15 years and older. Prevalence among men and women 15-59 was 23.5% in 2020.

Beginning in COP18, all ten districts of Lesotho became "scale-up saturation" districts. PEPFAR Lesotho is supporting 207 health facilities across the ten districts in COP21 with Prevention of Mother-to-Child Transmission (PMTCT), HIV testing, and HIV care and treatment. Voluntary medical male circumcision (VMMC) services will be synergized between PEPFAR Lesotho and GF, with services provided in the five lowland districts (Leribe, Berea, Maseru, Mafeteng, Mohale's Hoek) by PEPFAR Lesotho and in the five highland districts (Butha-Buthe, Mokhotlong, Thaba-Tseka Qacha's Nek, and Quthing) by GF. Key population (KP) activities will focus in Maseru and Leribe urban centers that border South Africa, where female sex workers (FSW) and men who have sex with men (MSM) are concentrated.<sup>1</sup>

Lesotho was ranked second highest in the world for HIV prevalence and highest in incidence among people 15-59 years through 2019.4 However, HIV incidence has been trending downward from 1.9% identified in the 2014 Demographic and Health Survey (DHS) to 1.1% in the 2016/2017 LePHIA and most recently to 0.5% in the 2020 LePHIA. Lesotho was the first country in sub-Saharan Africa to implement Test and Start in June 2016. In 2017, Lesotho adopted multi-month dispensing (MMD) for stable patients and in 2020 for pediatric patients. During COP21, Lesotho will continue to scale up index testing

in health care facilities, HIV self-testing (HIVST), Pre-Exposure Prophylaxis (PrEP), TB preventive therapy (TPT) and differentiated models of care completing a transition to TLD that began in August 2019.

In COP21, Lesotho will consolidate and enhance the eRegister program and health information exchange in 178 facilities supported by PEPFAR, enabling a unique identifier for all people living with HIV allowing case monitoring from the time the person tests for HIV. Retention in treatment is a barrier to epidemic control in Lesotho. The eRegister and health information exchange will provide the ability to track those on ART across facilities and clarify the extent of retention within the program. In February 2020 the Ministry of Health endorsed the Health Management Information System (HMIS) Strategic Plan 2018-2022 providing a policy for electronic medical records. In COP21 formalizing this policy for electronic data usage will be finalized.

Lesotho's government has been supportive of PEPFAR efforts overall, however stigma remains a barrier to HIV testing and treatment. Identifying the HIV infected and treating men and women 15-24 years of age is a key challenge and urgently needs to be addressed to reach the 90-90-90 goals in these populations. Frequent changes in key personnel at the Ministry of Health (MOH) and ongoing political issues threaten the success of Lesotho's national HIV program. The Government of Lesotho's (GOL) revised National Strategic Plan for HIV and AIDS (NSP) 2018-2023 endeavors to halve new infections and AIDS-related deaths by 2023 and eliminate mother to child transmission of HIV (MTCT), by focusing on two core programs and eight program results:

- 1. Expanded Access to Treatment and Combination Prevention
  - i. 95% of people aged 15 and over have accessed combination prevention;
  - ii. MTCT eliminated and 95% of children living with HIV on treatment;
  - iii. Test and treat cascade fast tracked to attain 95-95-95 targets.

#### 2. Social and Structural Enablers

- i. Gender and human rights related barriers removed
- ii. 75% of People Living with HIV/AIDS (PLHIV) at risk of and affected by HIV, benefit from HIV-sensitive social protection
- iii. At least 40% of the HIV/TB response is community-led and sustainable
- iv. Health system is people-centered and sustainably integrates HIV, TB and other infections
- v. Increased efficiencies and financial investments from less than 70% to 90% of the NSP budget

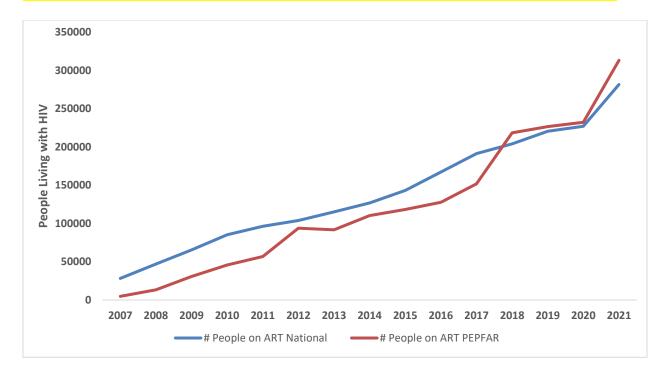

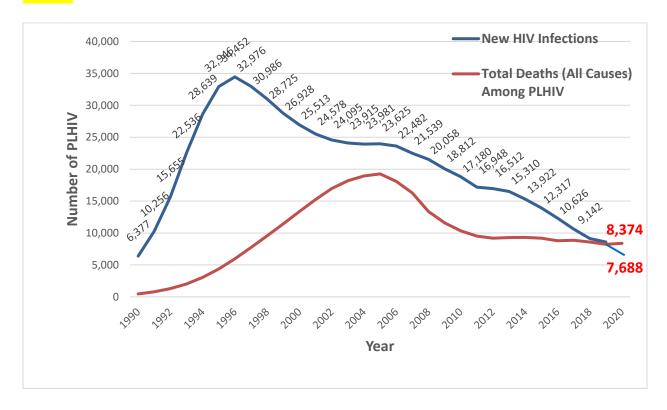

Figure 2.1.4. Updated Trend of New Infections and All-Cause Mortality Among PLHIV

## 2.2 New Activities and Areas of Focus for COP21, Including Focus on Continuity of Treatment

### **Continuity of Treatment**

Sustaining continuity of HIV treatment remains a major strategic priority for attaining and maintaining the second 95 goals of HIV epidemic control. The COP21 goal for the second 95 is improved quality of life and health outcomes for all PLHIV. The APR20 results showed that although the retention proxy was high at 95%, with 95% virally suppressed and 18,816 newly initiated on ART, the treatment growth was low at 2.5% (TX\_NET\_NEW of 5,714). Lesotho's TX\_CURR net growth is affected by high attrition men and women aged 15-44 years accounting for >90% of the clinical cascade attritions. Mortality rates maintain low at 0.5%. Interruption in treatment (IIT) for >28 days is the main cause of clinical cascade attritions with 14% lost within the first three months of ART initiation and 86% lost after having been on ART for > 3 months.

The main reasons accounting for 80% of missed appointments include working in South Africa (16%), at-work locally (14%), site documentation errors (12%), temporary travel (10%), felt cured/healthy (8%), forgot (6%), transport challenges (6%), self-transfers (4%), wrong addresses (4%), and at school (3%). A programmatic root cause analysis identified service delivery and systems-related barriers that included sub-optimal ARV ordering to meet the demand for services, incomplete documentation and triangulation of data across multiple clinical cascade registers, and frequent staff rotations impacting understanding of the PEPFAR and MOH reporting requirements.

During COP21, HIV treatment program growth will be fostered through four strategic priorities:

- i. Increasing treatment coverage in sub-populations that have not yet attained 90% coverage through improved test-and-treat services for newly diagnosed and pre-ART PLHIV and improving linkages to >95%;
- ii. Sustaining the gains achieved to ensure continuity of treatment;
- iii. Strengthen provision of quality client-centered services to prevent interruption in treatment (IIT); and
- iv. Avert morbidity and mortality among PLHIV.

Lesotho has a strong policy framework fostering same-day or rapid ART initiation for all PLHIV irrespective of CD<sub>4</sub> status. The program will consolidate the gains of intra-facility linkages using treatment Case Managers and strengthen the facility-community linkages either through active escort or integrated outreach. Early retention of newly initiated clients will be fostered through face-to-face and virtual counsellor enhanced adherence sessions, HIV treatment literacy including DSD planning, U=U education, provision of

optimized treatment regimens that have fewer side effects, and active tracking of those initiated at community level to ensure they receive their facility refill on time.

Program results demonstrate that active community tracking of missed appointments using community linkage coordinators and focal persons results in 74% return to care. In COP21, the program will expand the eligibility criteria of tracking efforts to include all beneficiaries at high risk of ITT (i.e. newly initiated on ART, children, adolescents, pregnant and breast-feeding women, viremic patients, and those with advanced HIV disease). The program will also strengthen inter-facility tracking of visiting clients, as a measure to offer flexible ART refills to clients during periods of intermittent service interruptions or increased travel restrictions due to the COVID-19 pandemic. The PEPFAR Lesotho program will continue to utilize treatment Case Managers that include professional counsellors, community focal persons, mentor mothers, youth ambassadors, or male coaches, and peers to offer client-centered support for continuity of treatment and sustained viral suppression. Retention Case Managers will be utilized to proactively track these high-risk clients, in addition to tracking all missed appointments. Scheduled community follow-up visits will also be provided based on client needs e.g. caregivers of children living with HIV for assisted disclosure, OVC-case management, pregnant & breastfeeding women and their infants.

### Programmatic shifts for tracking will involve

- Ensuring that >95% of all patients on ART are enrolled in the CommCare App to enable them receive SMS appointment reminders and enhanced virtual treatment support;
- Eliciting of >1 phone contact for all clients, including South African numbers to improve follow-up;
- Shortening the duration of the first tracking to be within 24 hours of a missed appointment;
- Ensuring that all clients who have interruption in treatment are promptly tracked at least three times to ensure linkage to care; and
- Institutionalizing a data triangulation day in all ART sites where the tracking outcomes are updated in the client ART cards, tracking tools, registers, and eRegister systems.

### **ART re-engagement services**

Re-engagement services will be expanded in all sites that account for 80% of the interruption in treatment rates, ensuring that at least 95% have documented tracking outcomes including facility to facility transfer documentation and linkage back to treatment. Clinical cascade attritions will inform site level performance benchmarks for return to treatment services and all sites will be monitored weekly to ensure they are on schedule to re-engage clients on ART. Professional Counsellors will serve as initial case managers for all newly re-engaged clients providing enhanced adherence counseling, telephone follow-up check-ins, and support to ensure timely viral load monitoring. All re-

engaged clients will be linked to existing differentiated service delivery models, e.g. male-friendly health care, adolescent-youth friendly health care, viremia clinics for the unsuppressed, weekend clinics for children, and PMTCT settings for pregnant and breast-feeding women.

### Multi-month scripting and dispensing (MMD)

MMD will be expanded for all stable children, adolescents, and adults on ART to attain 90% coverage, including provision of 3-6 month refills and appointment spacing. During COP21, the program will focus on increasing 6-month MMD coverage to 70% in stable PLHIV. MMD will be integrated in all differentiated service delivery models that include: (i) facility-based MMD, including pharmacy fast-track to reduce waiting times and decongest clinics; (ii) community ART delivery; (iii) community ART groups (CAGs); (iv) decentralized drug delivery models; (v) mentor-mother support groups for stable pregnant and breast-feeding women (including CTX refills for their HIV exposed infants); and (vi) mobile clinics for the high transit areas in Maseru and Maputsoe and the factory workplace program. All PLHIV receiving MMD will have at least one annual clinic visit to ensure timely viral load monitoring.

### <u>Decentralized drug distribution (DDD)</u>

DDD is a client-centered model targeting virally suppressed clients who prefer to pick up ARVs in the private sector, or face barriers for continuity of treatment due to a work schedule, in or out of country travel, or transport challenges. DDD is a patient-centered opt-in service delivery model, leveraging existing private sector providers (e.g. e-lockers, or pharmacy-in-a-box) to expand availability of ARVs drugs in urban and peri-urban settings located in catchment areas of high-volume, low-retention sites that may have long waiting times. The program will collaborate with the MOH, other donors, and private sector entities to layer on additional non-HIV-related disease commodities to leverage resources and reduce stigma and discrimination for PLHIV served through this model. The model is anticipated to improve retention among key target groups, including men. During COP21, the program will be expanded to three district i.e. Mafeteng, Maseru, and Mohale's Hoek. The DDD program will seek to integrate services with FP, condoms and other non-communicable disease drugs.

All participating beneficiaries will provide informed consent to enable the drug distributors reach them at convenient locations for their ART refills, adherence counseling, and retention support. Enrolled clients will set an appointment schedule for drug delivery and at least one annual clinic visit for viral load monitoring and will receive SMS reminders to ensure they are available to receive their refills on the agreed dates. Patients who miss scheduled pickups or have a change in clinical status (e.g. acute opportunistic infection, malnutrition, etc.) will be reverted to the health facility-based care until stable.

The MOH will provide ARVs for the DDD model (through the NDSO or targeted health units) and all distributors will ensure real-time updates of the site pharmacy stock records,

client ART cards, and eRegisters. PEPFAR, the MOH and private-sector pickup points will sign MOUs to agree upon incentives (e.g. delivery fee estimated at \$2 or consultations fee per client per drop-off) to ensure private sector participation in the program. Beneficiaries will receive ARV refills for free, but may be required to pay a fee-for-service for non-HIV related commodities.

Key implementation activities will entail a market analysis to identify potential alternative distribution points, attaining Government of Lesotho commitment to provide ARVs for this program, defining the initial population segments and program targets, training of private pharmacists in dispensing and reporting, and demand creation activities. Program performance will be monitored through monthly reports and support supervision to ensure that quality of services, proper documentation and commodity storage are maintained.

These COP21 strategic priorities will be scaled-up based on the volume of clients and collaborative quality improvement interventions for different target populations will be implemented at facility level. The PEPFAR Lesotho program will continue to foster learning to improve retention using facility QI teams and district QI coaches to improve the quality of services. Continuity of treatment interventions by specific subpopulations are covered in section 4.2 of the SDS.

### **Closing the Treatment Gap initiative**

The Closing the Treatment Gap initiative will build off lessons from the initial pilot that tracked Basotho that had been recorded as Interrupted in Treatment (ITT). External migration is a key determinant of sustained treatment retention with 24.3% Basotho aged 15-59 years (i.e. 30.9% of men and 17.8% of women) reporting having lived outside of Lesotho, at least 6% are away for one or more months, and with 95% being in the Republic of South Africa, (LePHIA, 2016-2017). The pilot program matched the ITT clients using first name, surname, date of birth and gender to identify them on the Tier Net system in four districts in South Africa. Preliminary results of the 45 matched clients showed that 76% were active on ART, 13% were Interrupted in Treatment in South Africa, 9% had transferred out, and 2% died. This initial pilot identified the economically active group aged 32-43 years, who had been on ART for at least 48 months, indicating it reached the subpopulation that contributed to the highest cascade attritions.

In FY21, a total number of 10,441 individuals who experienced interruption to treatment was generated from the 64 health facilities in 3 districts namely, Maseru (21), Mafeteng (21) and Berea (22). In South Africa, data matching of Lesotho patients based in South Africa is done using electronic profiling in several HIV care and treatment datasets. The matching process uses patient name, surname, date of birth and gender. From the patient records assessed, no Lesotho ID numbers were recorded and available for matching purposes. Of the total LTFU 5172 (49.5%) have the necessary details to be tracked in South African databases.

A community tracking component will be included to identify treatment outcomes for Basotho who experienced interruption in treatment in South Africa or transferred to other sites to confirm treatment re-engagement. This component will be attached to the DDD initiative.

### 2.3 Investment Profile

In Lesotho, the GOL, GF, and the United States Government (USG) through PEPFAR primarily fund the HIV response. Over the past few years, PEPFAR Lesotho's budget has significantly increased from \$34 million in COP15 to \$82 million in COP20 with a decrease to \$75 million in COP21. Overall, PEFPAR's percentage of the national HIV response has therefore increased over the past five years. Historic GF expenditure for the two-year grant from 2016-2018 was just under 80%. The current grant 2018-2021 is \$67 million.

Historically, the GOL has maintained their commitment to the HIV response, especially the procurement of ARVs. In COP19, this commitment has wavered, and gaps in funding required immediate attention from GF and PEPFAR.

Table 2.3.1 shows that the total HIV expenditure in 2019 (PEPFAR) and 2018 (GF and GOL) was \$149,899,281. The 2020 Resource Alignment showed that PEPFAR's contribution to the national response in 2018 was 51% of the HIV expenditure. The largest cost categories are those directly associated with achieving the 90-90-90 goals.

Table 2.3.1 Annual Investment Profile by Program Area							
Program Area	Total Budget	% PEPFAR*	% <b>GF</b> *	% Host Country <sup>†</sup>			
Care and Treatment	\$ 78,672,067	36.6%	3.5%	59.9%			
HTS	\$ 12,771,261	75.6%	3.0%	21.4%			
Prevention	\$ 19,266,018	45.0%	14.6%	40.4%

Total (including commodities)	\$ 149,899,281	51.0%	8.0%	41.0%			

\*2021 PEPFAR HIV Resource Alignment (2021 budget)

Table 2.3.2 shows that GOL procures the majority of commodities, with a particular note around the continued commitment for the procurement of ARVs. PEPFAR continues to secure viral load commodities, PrEP and VMMC kits. GF continues to procure ARVs, test kits, TPT commodities, reagents, and other commodities. In 2019, the GOL was not able to fulfill their historic contribution to ARVs. This caused an immediate response from GF to fill the gap.

Table 2.3.2 Annual Procurement Profile for Key Commodities

### 2.4 National Sustainability Profile Update

PEPFAR Lesotho completed a Sustainability Index Dashboard (SID) in August 2019 to assist with identifying areas of weakness that are critical to the HIV and AIDS response and the attainment of epidemic control in Lesotho. Among the 17 sustainability elements, sustainability strengths were "planning and coordination" (dark green), "policies and governance" (light green), "technical and allocative efficiencies" (dark green), and "performance data" (light green). All elements within the national health system and service delivery and strategic information domains (except for performance data) were identified as sustainability vulnerabilities. Lesotho's COP21 above-site investments have been appropriately allocated to address these sustainability vulnerabilities, specifically in the following elements: 1) service delivery; 2) commodities security and supply chain, 3) laboratory; and 4) epidemiological and health data. There has been a modest increase in the SID score for commodities security and supply chain, laboratory, and epidemiological and health data between 2017 and 2019. Service delivery, however, has decreased slightly in the SID score. In light of this, PEPFAR Lesotho will continue to invest in HIV program coordination and policy and guidelines development, particularly for technical assistance in pediatric ART optimization, increasing TB preventive therapy coverage among PLHIV, implementing the advanced HIV disease package, and scaling up 6 months multi-month dispensing.

In COP21, PEPFAR Lesotho will continue to focus above-site investments in commodity security and supply chain, laboratory systems, HIV Recency, and epidemiological and health data due to sustainability vulnerabilities in these areas as the program transitions to host-country led.

In collaboration with the Government of Lesotho, Civil Society, and other stakeholders, Lesotho will be conducting its next SID this year in 2021, which will allow us to continue to assess the sustainability of the HIV response and understand the functional and financial barriers to transition of PEPFAR programs.

### **Commodity security and supply chain**

PEPFAR Lesotho will continue to support the MOH to strengthen commodity security, an element that is critical in helping Lesotho maintain epidemic control. For example, Lesotho requires a stable supply of ARVs to ensure scale up of 6 months multi-month dispensing and adequate access to PrEP which is also continuing to scale-up. PEPFAR Lesotho will provide technical support and capacity building to the Supply Chain Management Directorate (SCMD), District Health Management Teams (DHMTs) and the National Drug Services Organization (NDSO) to ensure that there is a fully functional GOL-led HIV/AIDS commodities and supply chain management (SCM) system, which can guarantee 100%

commodity security for all HIV-related commodities. New to COP21, PEPFAR will help support the development of a sustainable financing strategy for essential HIV commodities. Laboratory systems

Laboratory services are vital to HIV service delivery and will be supported in COP20 through: 1) laboratory network optimization by strengthening the local referral networks through tiered lab services; 2) strengthening the Laboratory Information System (LIS) and monitoring and evaluation (M&E) system, including dashboard and data visualization; 3) supporting the laboratory quality system, biosafety, and waste management and; 4) supporting the national quality assurance program. This will ensure improved VL coverage of 100% by the end of COP21 (refer to Section 5.0 for more details). Epidemiological and health data

Optimization of information systems such as eRegisters and DHIS2 at the health facility level will ensure timely, complete, and accurate data management to inform programmatic planning by the host country. National rollout of electronic registers (eRegisters) will ensure a viable unique identifier system that will allow patients to be tracked across health facilities and allow for the sustainable measurement of the cascade of HIV services. Furthermore, identifying HIV recent infections will enable a system of case-based surveillance to prevent, detect, and intervene on the epidemic, especially once Lesotho reaches epidemic control.

### **Donor investment and transition to indigenous partners**

PEPFAR Lesotho is currently investing in the appropriate areas to sustain epidemic. Planning and coordination will need to be refined as Lesotho transitions from a donorcentered environment to one that is host country-led. Once the systems for laboratory, supply chain, and health information are established and optimized, knowledge and skills transfer through our current implementing partners should enable the host country to assume operations. For full ownership, however, the host country will need to continually invest resources in the maintenance of these systems, including procurement of essential commodities. In addition, the host country will need to determine the level of human resources, including types of health cadres, to maintain the epidemic control and be ready to increase financial investments in human resources, infrastructure and systems. The Global Fund has been supporting the GOL in developing an HRH Strategic Plan. Together with PEPFAR's HRH Inventory 2020, we can work towards a right-sized healthcare workforce. It should also be mentioned that political instability, corruption, limited technical capacity, and now the COVID pandemic, are challenges that cannot be fully addressed by the PEPFAR Lesotho program but can seriously affect the sustainability of its response.

Since COP19 and COP20, PEPFAR and GF have maintained and synergized resources in Lesotho to address gaps in sustainable epidemic control. In its current grant, GF has been investing in resilient and sustainable systems for health through human resources

(including village health workers), strategic information systems, and procurement and supply chain management systems.

PEPFAR Lesotho will increasingly work with and implement activities through indigenous partners to build local capacity, increase program sustainability, and ensure sustainable epidemic control. PEPFAR agencies have taken measured steps to increase funding towards local, indigenous prime partners. For USAID, current transition milestones are set at reaching 48% of their portfolio to be implemented by indigenous entities, by COP22. USAID awarded the OVC/DREAMS grant and transferred portions of their care and treatment portfolio to local partners in COP19. In COP21 USAID will continue to support capacity development of local partner subs in preparation of transitioning these organizations to a Prime role. CDC will develop a new HIV Prevention cooperative agreement that will allow the prime partner to provide capacity building activities to their sub-awardees and will provide preference points to local applicants, to be awarded in COP21. Furthermore, CDC will continue to incorporate health system strengthening activities for the MOH in all new awards to develop local capacity.

### 2.5 Alignment of PEPFAR investments geographically to disease burden

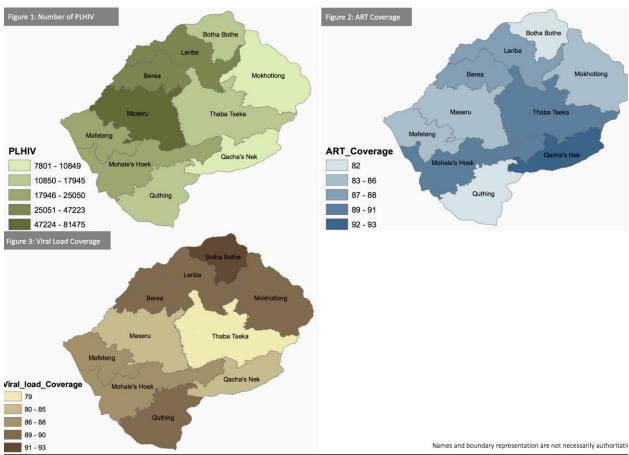

HIV prevalence has decreased overall, from 25.6% (LePHIA 2016/2017) to 23.5% (LePHIA 2020) and in all districts (except Butha-Buthe). According to LePHIA 2020, prevalence remains similar among most districts in Lesotho, ranging from 19% in Butha-Buthe to 24% in Mohale's Hoek. There was a statistically significant difference in prevalence between Butha-Buthe (18.5%; 95% CI: 16.2% – 21.4%) and Maseru (23.6%; 95% CI: 21.7% - 25.6%). The HIV burden in Lesotho, however, remains in the more densely populated and more urban lowlands to the west and southwest of Lesotho, which encompasses the districts of Maseru, Leribe, Berea, Mafeteng, and Mohale's Hoek. In COP15, these five districts accounted for 74% of all PLHIV and have been PEPFAR "scale-up" districts. In COP17 and COP18, Lesotho started to approach epidemic control and therefore expanded to 45 sites in the five highland (formerly "sustained") districts, leading to 99% coverage of PLHIV on ART. In COP21, PEPFAR will remain in these 207 sites to maintain care and treatment activities and ensure continuity of treatment for PLHIV.

In COP20, PEPFAR Lesotho expanded DREAMS from the districts of Maseru and Berea to the districts of Mafeteng and Mohale's Hoek. This expansion has provided DREAMS coverage in four of the five lowland districts, which contain majority of the AGYW (as well as AGYW living with HIV) in Lesotho. The GF has traditionally implemented DREAMS-like activities in all the other 8 districts in Lesotho. In COP20, GF exited Mafeteng and Mohale's Hoek and reinvested the efficiencies generated from this transition into Leribe (34,734 AGYW) to scale-up the AGYW programming in this district, while maintaining level investments in the five highland districts.

In COP21, PEPFAR Lesotho will continue the COP20 expansion of DREAMS from the districts of Maseru (47,827 AGYW) and Berea (21,315 AGYW) to the districts of Mafeteng (13,902 AGYW) and Mohale's Hoek (12,226 AGYW).

Figure 2.5.1. PLHIV, treatment coverage, and viral load coverage by SNU.

LESOTHO: People Living with HIV (PLHIV), Treatment Coverage & Viral Load Coverage

Source: LePHIA 2020 and PEPFAR Program data

### 2.6 Stakeholder Engagement

COP21 development included various stakeholders from the MOH, civil society organizations (CSOs), GF Country Team, National AIDS Commission (NAC), United Nations Agencies, faith-based organizations, PEPFAR implementing partners, and other select local non-government organizations in a three-day stakeholder retreat from 26th to 28th January, 2021.

Prior to these meetings, COP21 guidance and Planning Level Letter, along with critical data and materials (2019 Sustainability Index Dashboards and Responsibility Matrix; COP20 SDS and Approval Memo; FY20 Q4 results via Spotlight) were disseminated to all stakeholders to allow them to come prepared with a baseline understanding of PEPFAR achievements and gaps and to allow for enhanced input. These stakeholder strategic planning meetings were well-attended and well-engaged. Stakeholders expressed general agreement with many of the COP21 strategic approaches, particularly1) client-centered care; 2) enhanced continuity of treatment strategies for PLHIV on ART, especially MMD and TLD transition; and 3) maintaining community-based monitoring.

Two separate meetings were held with CSOs (Feb 4 and April 1) to address any concerns and questions and to ensure that the COP21 plans were aligned to CSO priorities. On Feb 4<sup>th</sup>, CSOs wanted to see more resources allocated to community-led monitoring; migrants; treatment literacy; COVID; condoms; and youth-friendly services. In addition, they advocated for more funding to CSOs to allow them to implement the programs of which they are the primary beneficiaries. On April 1<sup>st</sup>, CSOs agreed with the investments towards eRegisters and continuity of treatment services, particularly 20-24 year old. In addition, they advocated for increased capacity building efforts to CSOs as PEPFAR starts to transition – they believe that the GOL alone cannot be made responsible for the HIV response in Lesotho.

Representatives from the MOH, CSOs, GF Country Team and GF prime recipients, WHO, and UNAIDS participated in the two-day, virtual planning meeting on April 15-16, 2021. Stakeholders contributed to effective discussion and agreed on the collaborative objectives and strategic priorities for COP21.

The draft COP21 strategic direction summary was distributed to all stakeholders prior to submission on 26<sup>th</sup> April 2021.

### 3.0 Geographic and Population Prioritization

As described above, a total of 207 treatment sites have been supported since COP18 with nearly all facilities having a minimum of 200 PLHIV on treatment. Supported sites accounted for 99% of persons currently on treatment in Lesotho.

Table 3.1 presents the current status of ART saturation and progress towards 95/95/95 across SNUs

Table 3.1 Current Status of ART saturation							
Prioritization Area	Total PLHIV/% of all PLHIV for COP21*	# Current on ART (FY20)	# of SNU COP20 (FY21)	# of SNU COP21 (FY22)			
Attained	N/A	N/A	N/A	N/A			
Scale-up Saturation	<mark>279,030/92%</mark>	<mark>232,304</mark>	10	10			
Scale-up Aggressive	N/A	N/A	N/A	N/A			
Sustained	N/A	N/A	N/A	N/A			
Central Support	N/A	N/A	N/A	N/A			

<sup>\*2020</sup> Spectrum (FY21 Q3 data)

The result of the 2020 LePHIA shows significant stride in reaching 90-90-90 goals with national coverage of 90% of PLHIV diagnosed, 97% of those who know their status on treatment, and 92% of those on treatment virally suppressed.

In COP21, populations to be prioritized include children (1-4 years old), adolescents/young adults (15-19 years) and males especially among 20-34 years old as they currently have the lowest ART coverage rates across all districts. During COP21, a special attention will be made to increase the ART coverage in highland districts especially in Quthing and Thaba Tseka. Efforts to reach these priority populations include HIV testing services (HTS) focused on self-testing and indexing and establishment of additional men's clinics and adolescent corners in high-volume sites. Preliminary data indicate that these efforts have been successful in attracting greater numbers of PLHIV in these two groups. At these sites, we have been able to achieve high HTS yield, linkage to treatment, and retention.

In COP21, PEPFAR continues to provide VMMC services in the five lowland districts, with a target population of ages 15-29. Enhanced efforts will be made to provide VMMC to men who have already undergone traditional circumcision. Overall coverage as of COP20 Q1 was 58% for males 15-29 years of age, ranging from 46% in Mohale's Hoek to 66% in Maseru. The COP21 goal is to achieve 80% VMMC coverage among males 15-29 years of age in the five lowland districts supported by PEPFAR (GF provides support for VMMC in the five highland districts).

# 4.0 Client Centered Program Activities for Epidemic Control

### 4.1 Finding the missing and getting them on treatment

Lesotho is one of the few PEPFAR-supported countries that have achieved the UNAIDS 90-90-90 targets for the year 2020. According to the LePHIA survey 2020, 90% of people living with HIV in Lesotho were reported to know their HIV status, and of these 97% were on treatment and 92% of those on treatment were virally suppressed. While this is a commendable achievement, the program continues to aim for 95-95-95 by 2030 at all levels from national, district to age and sex bands in order to fully control the epidemic. The PEPFAR Lesotho HTS program's main role therefore is to ensure effective and sustainable case identification and strong linkages to ART to meet the treatment numbers in the PEPFAR supported sites for all sex and age disaggregates. HTS targets are back calculated to achieve a national ART coverage of 90% and 95/95/95 across all sex and age bands by SNU for epidemic control at the national level. In FY22, the PEPFAR Lesotho program will provide HTS to 119,671 adults and children to identify 11,133 new people living with HIV and link 95% to care and/treatment services; resulting in an aggregate positivity rate of 9% (10% for adults, while the yield for children will be 2%). These targets were derived using the unmet ART need data by age, sex and district, factoring in yield by age and modality assumptions for the different populations and approaches.

FY21 HIV case finding approaches reflect a pivot in HTS programming to evolve with the country's changing epidemic. In FY22, the PEPFAR supported care and treatment implementing partners will be responsible for all HIV case identification and linkages to treatment to ensure minimal loss of patients through the cascade and ensure cost efficiencies in the program, building towards sustainability in the era of epidemic control. Community case identification will be limited to tracking of index contacts that are not able to come to the health facilities and/or prefer community-based testing. HIV self-testing will be used as an additional approach for index contacts that are not reachable by other means. It will also be used in all testing points for low-risk groups as an additional risk-screening approach in order to improve the case-finding yield for PITC.

In FY22, 66% (men at 71% and women at 57%) of all cases will be from index testing, and only 16% from other PITC which will be highly targeted and based on risk. TB, PMTCT and diagnostic testing will be other entry points through which positives are identified. Index testing all new HIV positive and unsuppressed women living with HIV will be the main modality for identifying children living with HIV (CLHIV)- contributing 75% of positives, while other PITC contributes 15%, and the rest are identified through other approaches. In COP21, the program will identify 7,160 men living with HIV nationally. Particular focus will be placed on young men 20-35 years of age and CLHIV as informed by the treatment coverage gap in these groups. For male case finding, Lesotho's signature men's clinic model and other male friendly approaches which offer HIV services integrated with primary

health care for men will continue to be fully utilized and combined with risk screening informed testing.

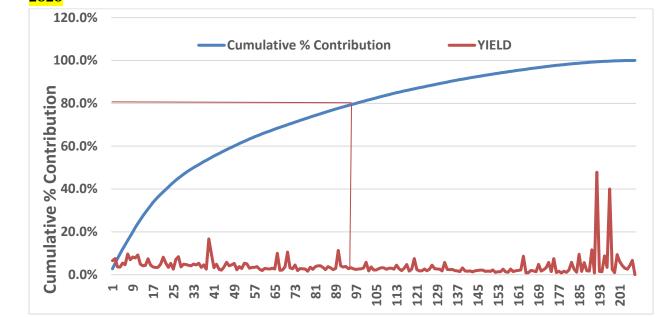

- <u>Index testing</u>: Health facilities have traditionally been successful in identifying mainly females living with HIV; these new female cases will be effectively indexed to reach their male partners. The program will use supportive client-centered approaches to enhance testing of partners such as assisted partner notification, transport reimbursement, flexible testing hours, and client-preferred testing venues.
- <u>Self-test</u>: Targeted primary and secondary distribution of HIV self-test (HIVST) kits will also be used to reach men who do not normally interact with the health system. Targeted community and risk and demand-based distribution at facility level will be intensified to reach men. For the adult population, a total of 257,283 HIVST kits will be distributed in FY22, with 155,875 among females (61%) and 101,408 (39%) among men. Among men, over 74% (74,891) will be distributed to 20-39, a group that has the highest unmet need for treatment. The program will leverage social networks and media platforms to reach young men with demand creation and distribution.
- <u>Recency</u>: Routine surveillance data from the recency testing program will be fully utilized to map hotspots for targeted HIVST distribution, index testing, prevention and other related services to target areas of new infections.
- Other: Intensive screening of TB suspects and cases will be another modality which will bring in 11% of the male HIV cases in FY22 while risk based PITC will contribute 17% of the new male cases.

Higher than acceptable volumes of HIV testing numbers continue to challenge the health system with a decreasing positivity rate as the country approaches epidemic control. The program has taken a data driven approach to develop and roll-out a risk screening tool in FY20, this has been rolled out nationally in FY21,; the impact of this is seen in the improving site level yields and this will be closely monitored for fidelity and efficiency in FY22 to maintain targeted and efficient case identification.

Testing volumes by site will be monitored on a monthly basis to ensure an increase in the positivity yield and decrease in the volume of testing numbers. All HTS partners will continue to participate in monthly progress meetings to monitor trends and ensure scale and fidelity of these case finding approaches. Program monitoring will be strengthened at site level through SIMS, program monitoring visits, and community led monitoring to identify performance issues, adherence to minimum standards, and target relevant interventions to poor performing sites, and use best practices from the highest performing sites across the program.

Figure 4.1.1 shows that as of APR20, 80% of Lesotho's HIV cases came from 47% of the sites. Since the roll out of the risk screening tool, proportion of sites reporting a yield between 2-5% has dropped from 84 to 47%, increasing that proportion that reports >10% yield from 3 to 21% from FY20 to FY21. Using routine site-level yield analysis, the aim of the program is to ensure all sites improve on case finding and reduce the overall volume of testing through the use of the screening tool.

Figure 4.1.1. Site level analysis for yield and % contribution to OU positives in April 2020

In FY22, the PEPFAR Lesotho program will therefore make the following pivots in the case identification strategy to enhance case finding for underserved age and sex populations:

- Strengthen and monitor the use of the risk screening tool to increase case identification in facilities
- Use HIV self-testing as an additional risk screening approach to enhance targeted case identification.
- Use site-level data to monitor yield and testing volumes for outpatient departments
- Scale up index testing and partner notification services prioritizing new positives and viremic clients to ensure an adult positivity of at least 20%, and contribution of 66% from index modality
- Scale up recency testing and integrate with the index modality to target recent infections and hotspots with relevant interventions including HIVST and PrEP
- Integrate HIV self-testing in all testing modalities and use it as a screening approach for low-risk groups such as in VMMC clients and other testing for prevention program.

- Support and collaborate with key stakeholders to promote community education and U=U messaging to increase acceptability for index testing and partner notification services
- Strengthen linkages to treatment through same day ART and physical intra-facility escorts

### 4.2 Retaining clients on treatment and ensuring viral suppression

The COP21 goal for continuity of treatment is to ensure increased access to quality and client centered ART services to attain durable viral suppression, prevent HIV transmission, and improve the health and wellbeing of PLHIV in all sexes and age-groups. This is in alignment with PEPFAR/ Lesotho's strategic framework goal of ensuring HIV programs are accessible and responsive to the varying needs of Basotho so that they can lead healthy productive lives that are not disrupted by treatment and prevention services. As noted in section 2.2, the APR2020 results show continuity of treatment is affected by high attrition rates along the HIV clinical care cascade. In terms of numbers, treatment losses are highest among those aged 25-39 years, and the proportion of children <15 years who exit the clinical cascade is high.

Program results show that among PLHIV who did not have any clinical contact for more 28 days, 69% were lost-to-follow up, 18% were confirmed to have transferred out to another site, 12% refused treatment, and 1% died, (with more deaths recorded among those ages 50+ and 30-39). The proportion of treatment interruption is higher among those who have been on ART for <3 months compared to those who have been on ART for >3 months, demonstrating the impact of the MMD scale-up. During COP21, continuity in treatment interventions will target sub-populations with the highest attrition rates, treatment refusal, and mortality. Successful retention of transfer-outs will also be fostered through continued provision of differentiated service delivery, including MMD for eligible beneficiaries.

PEPFAR Lesotho direct service delivery support at site level is limited to health units that have at least 200 PLHV on ART and a few specialized clinics that offer services for KP, prisoners, and tertiary institutions (see Figure 4.2.1 below). The COP21 site level support for improved retention will continue to focus on these clinics. Site volume analysis shows that 51.2% of sites account for 80% of the total FY20Q4 treatment results and these will be prioritized for scaling up the core client-centered retention service package that includes differentiated care, active tracking for re-engagement back in to care, integration of collaborative quality improvement to address site-level clinical cascade gaps, and community treatment literacy.

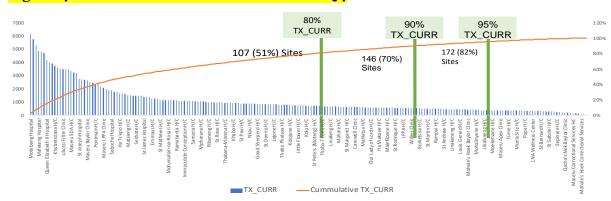

Figure 4.2.1. TX\_CURR site volume in FY20Q4

The sections below provide core COP21 continuity of treatment retention priorities for different sub-populations that include newly initiated, viremic/unsuppressed, children and adolescents living with HIV, and stable adult women and men.

### 4.2.1. Newly initiated on ART treatment

The national policy guidelines for 2016 recommend Test-and-Treat for all people living with HIV irrespective of CD4 cell counts. During COP21, the PEPFAR Lesotho program will focus on providing same-day ART initiation for all PLHIV who are ready to start ART at facility and community levels. The program will continue to strengthen intra-facility and community-facility linkages to attain >95% proxy linkage through the use of linkage navigators and focal persons to escort clients to clinicians to initiate ART. The program will continue to provide integrated outreaches to increase access for hard-to-reach areas and health posts, and expand differentiated care for priority populations like men, children, adolescents, and youth through provision of client-friendly health care, flexible working hours (e.g. weekends, early morning or late evening), and one-stop shop ART refills. Continuity of retention will be strengthened through the provision of more efficacious ART regimens including DTG-based regimens and more optimized pediatric regimens, including DTG 10mg dispersible tablets.

Early retention will be fostered through virtual and face-to-face enhanced counseling on ART literacy during the pre-ART initiation, counselor-led 7-day follow up, SMS reminders on clinic appointments, and linkage to treatment Case Managers that will provide adherence support and peer support on coping with a new diagnosis. Adherence assessments will be conducted at each clinic visit and enhanced adherence counseling will be offered to those who are at risk of interruption in treatment. Active community tracking will be strengthened prioritizing those who are not ready for same-day ART initiation, with a presumptive TB diagnosis, or advanced HIV disease to ensure access to treatment. Patients with advanced HIV disease will be screened to rule out Cryptococcal Meningitis or active TB disease to enable rapid ART initiation.

### 4.2.2. Unsuppressed or viremic PLHIV

The FY2oQ4 results show that 4% of the total adults and children currently on ART are virally unsuppressed and viral suppression levels increase with age. During COP21, all viremic PLHIV will be prioritized to intensified clinical monitoring at facility and community levels. PEPFAR will continue to support the national and district ART Advisory Committees who oversee and recommend the provision of more efficacious second line regimens for those confirmed to have treatment failure. Health care service providers will be trained on the management of viremic PLHIV, including provision of enhanced adherence counseling that will screen for mental health challenges, repeat viral load monitoring, ensuring timely evaluation for second line if no improvement.

Treatment Case Managers will be allocated to each viremic client to provide ongoing virtual and face-to-face adherence and retention support at facility and community levels, including appointment reminders and peer support to improve treatment literacy. Active tracking will be initiated on the day that the viral load results are received at the site to ensure clients return back to the clinic early to start enhanced adherence counseling.

Professional counsellors will be trained on the provision of age-appropriate enhanced adherence counseling, including caregivers of viremic children. The inter-partner collaboration of the OVC and clinical implementing partners will be strengthened to ensure all viremic children are linked to OVC case managers for additional socio-economic support at community levels. Sites with a high volume of viremic PLHIV will be prioritized to establish viremic clinics, including weekends to reach children, adolescents, men, and external migrants.

#### 4.2.3. Children and adolescents

PEPAR Lesotho will support MOH to achieve >95% treatment coverage for CLHIV, initiate more efficacious ART regimens by age, and ensure viral suppression and retention in care. As of APR 20, program data shows lower viral suppression rate and coverage for children and adolescents compared to adults. During COP 20, the PEPFAR Lesotho program focused on transitioning eligible CLHIV to LPV/r pellets. During COP21, the program will focus on transitioning eligible CLHIV to DTG 10mg dispersible tablets. Point-of-care viral load testing will be scaled up to address the unmet need for viral load coverage among children and adolescents. Clinically stable CLHIV and adolescents will be enrolled into differentiated service delivery including MMD and CAGs to support continuity of treatment. During COP21, the benchmark for C/ALHIV in MMD coverage is set at 75%, up from 50% in COP19 and 65% in COP20. The human centered design approach will be utilized to improve feedback from adolescents and young people on how services can be improved to address their unmet needs and improve access and adherence.

The ANC sentinel survey in 2018 revealed that adolescent girls aged 15-19 years account for 22% of ANC attendees, while those aged 20-24 represents 33% of pregnant women in ANC. Therefore, PEPFAR Lesotho support to adolescent friendly health corners will be strengthened to support prevention and screening for HIV, STIs and TB and incorporate Operation four Zero (O4Z) into the already existing psychosocial support group (PSG) clubs and make children and adolescents more self-resilient and responsible for their own health.

Children who are under the age of 10 and those who are not able to enroll into teen clubs/ O4Z will continue to have their age appropriate psychosocial support groups which will meet on a monthly and quarterly basis. During the PSS group meetings children will also receive clinical services as well as viral load /DBS specimen collection so that they do not have to miss school during weekdays coming for clinical consultations. As a strategy to improve retention in children and adolescents the country will scale up DSD for children and continue to explore other means of getting health care facilities comfortable for them. Caregivers who have challenges disclosing HIV status to their children will have trained health workers to support them during the disclosure process. There will be regular scheduled meetings of caregivers and health workers to train and refresh caregivers on the importance of ART, methods of treatment administration, reasons why it should not be stopped unless there are some clinical indications and address potential challenges which come with age and lifelong treatment and have them share the strategies that may work better under different circumstances.

Lesotho MOH with PEPFAR support will continue to coordinate clinical and supply chain implementing partners to ensure that the health facilities do not run out of recommended efficacious ART regimens and regularly review progress on pediatric ART coverage and retention in care. Children who experience challenges with adherence and viral suppression will be linked to the OVC program for continued support at the community level.

### **OVC Program**

In COP21, the Lesotho OVC program will continue to focus on the key challenges for children in the epidemic specifically the pediatric treatment gap, the high rate of sexual violence against adolescent girls, and the risk to children posed by poor adult treatment retention and viral suppression rates. The leading priority for Lesotho currently is to prioritize comprehensive wraparound services for CLHIV and their families, including adherence and disclosure support, HIV testing, VL testing, and MMD services. The program will also continue to provide OVC Preventive curricula for boys and girls 9-14 years, through the OGAC-approved HIV and violence prevention curricula- Rethabile Teens (PLH), and Coaching Boys Into Men.

The program will continue working on clear and confirmed collaboration with the clinical partners. This will be done through the continuation and updating of existing MOUs,

which include agreeing on shared confidentiality and working together on bi-directional referral protocols to ensure full support on retention of children and adolescents in treatment and care.

The OVC program will maintain priority subpopulations: CLHIV, HEI, Children of PLHIV, Children of KP, SVAC survivors. OVC community networks will help to find children who are infected with HIV (including those who are older and/or asymptomatic), but whose lack of routine contact with health centers makes them less likely to be diagnosed through traditional clinic-based HIV testing modalities. The OVC program will also prioritize coordination with clinical programs to support the scale-up of index testing of biological children of mothers living with HIV.

To date (FY21) the OVC implementing partner (IP) has established formalized partnerships with testing and treatment partners to rapidly increase the number of "well" children found and treated. Treatment partners regularly share the list of CLHIV on treatment with the OVC IP. M2M through their mentor mothers also is linking the new mothers to the OVC partner for household assessments for comprehensive OVC services. The Lesotho OVC program will offer enrollment to 90% of all children living with HIV below 19 who are currently on treatment, and they are also being used as an index to the family.

In COP21, the Lesotho OVC IP, with its wide community reach and social protection expertise, will play a key role in ensuring that HIV-infected or HIV-affected children and their parents are retained in care through home visits that promote adherence to ART, accompaniment to clinics, and provision of socioeconomic assistance. Lesotho also prioritized the other four subpopulations to be served under the OVC program: the children of PLHIV, children of female sex workers, children exposed or experiencing violence, and HIV exposed infants. The GOL through the Ministry of Social Development acknowledges the association of HIV and violence with orphan-hood and disability in Lesotho and has included these groups in the priority subpopulations.

However, new enrollment of these groups will not occur during COP21, and focus on only maintaining support for those already enrolled in the program and still in need of services. In order to create space in the cohort to offer enrollment to 90% of CLHIV on treatment, some existing beneficiaries may need to be graduated or exited without graduation from the program. Beneficiaries will be assessed for graduation and those that are closest to graduation will be supported to graduate from the OVC program. Those who are not ready to graduate but meet certain categories will be exited without graduation and transferred out to other government supported programs. For example, subpopulations including children who are HIV negative and whose HIV positive parent is virally suppressed, and orphans who are HIV negative and do not have an HIV positive caregiver will also be graduated or exited in order to make space in the program for CLHIV.

### 4.2.4. Adult women on ART

The LEPHIA results show women have a higher HIV disease burden. Although the proportion of PLHIV currently on ART who have interruption in treatment is higher in children, women aged 25-39 years have the highest volumes of patients on ART with interruption in treatment, largely attributed to the fact that women account for 65% of the total clients currently on ART. Although the program has sustained high viral load coverage at 82% and virologic suppression rates of 95% among WLHIV on treatment, major barriers of continuity of treatment exist that are related to the impacts of the COVID-19 pandemic, long waiting times, sub-optimal differentiated service delivery, lack of transport, sub-optimal knowledge on the benefits of treatment, and socio-cultural barriers (e.g. disclosure of HIV status, intimate partner violence/gender-based violence, stigma and discrimination). In addition, treatment retention is also affected among the women of working age who travel for work and live outside of Lesotho for extended period of time. According to LePHIA 2017, 17.8% of women reported that they live outside of Lesotho, including 4.8% who live outside of the country for one month or more, and over 58.9% travel outside of the country due to work, mainly in the Republic of South Africa. Figure 4.2.5.ii. provides the LePHIA 2020 ART coverage and treatment gap in adult women.

During APR20 implementation, the program's treatment growth has remained flat for adult females due to the high treatment new net losses (TX\_NET\_NEW). The FY20Q4 treatment data shows overall net gain of 3,867 females aged 15+ between FY19Q4 and FY20Q4. At the end of FY20Q4, a total of 146,192 females (15+) were reported to be current on treatment. Estimated viral load coverage was 84% and 97% viral suppression rates. MMD coverage among adult females increased from 43% in FY20Q1 to 82% in FY20Q4 (see table 4.2.4.i).

Table 4.2.4.i. MMD coverage for adult females ages 15+						
ARV Dispensing quantity	FY20Q4 Adult females receiving					
ARV Dispensing Quantity - 3 to 5 months	87,562 (58%)					
ARV Dispensing Quantity - 6 or more months	36,015 (24%)					
ARV Dispensing Quantity - Less than 3 months	21,582 (14%)					

During COP21, the program will use a women-centered approach to address barriers for continuity of treatment among adult women. The program will continue to implement the revised national treatment policy guidelines by scaling up the provision of optimized ART regimens, (e.g. DTG, including women of reproductive potential to improve treatment retention, ensure sustained virologic suppression, reduce morbidity and mortality, and reduce the risk of HIV transmission).

Differentiated service delivery models to reduce clinic visits, long clinic waiting times, and risk of interruption in treatment will be scaled up through the provision of MMD, DDD, community ART delivery, CAGs, and peer-supported drug delivery using mentor mothers to attain at least 90% coverage for all stable WLHIV. Three- to six-month MMD will be provided based on national ART commodity stock levels. Clinic appointments for stable

adult WLHIV will be reduced to at least annually to ensure timely viral load monitoring. High volume clinics in urban or near border crossings will provide migrant-friendly services during the peak seasons of December and April for those traveling home from South Africa that will include extended working hours (including weekends), 6-month MMD, fast-tracking viral load testing and return of results. Enhanced adherence counseling will be provided at each clinic visit and during community peer support group sessions (e.g. CAGs and mentor-mother support groups) to enhance treatment and viral suppression literacy and address any knowledge gaps on treatment benefits.

Community-facility tracking for all missed appointments, defaulters, transfer-outs, and interruption in treatment will be strengthened to enhance linkage back to care. Treatment Case Managers that include Lay Counsellors, community Focal Persons, and mentor mothers will be utilized to track both facility-community and inter-facility service uptake and all tracking outcomes will be updated in the tracking tools. All community tracking efforts will be informed by granular site data analyses by age- and-gender to identify clinical cascade attritions, and service delivery models will be adopted to match the reasons for defaulting treatment. Differentiated service delivery models will be maintained for those who are re-engaged back in to care, including welcome back messaging.

Socio-cultural barriers will be addressed through the provision routine intimate partner violence (IPV)/gender-based violence (GBV) screening in all service outlets (e.g. ART Clinic, PMTCT, OPD clinics, etc.) and training health care workers on the minimum post-GBV care package. The program will collaborate with existing community structures to strengthen health education on treatment literacy, U=U messaging, and creating demand for MMD uptake.

Integrated PMTCT, ART, voluntary & informed choice FP, and EID services will be provided to all adult women of reproductive potential to reduce any retention barriers related to clinic transitions. Health care workers will be multi-skilled to provide client-centered services for mother-infant pairs with a greater focus on family centered care and clinic appointment spacing based on the HIV, obstetric, or child health care needs of program beneficiaries. Point-of-care viral load monitoring for PBFW will be provided to ensure 100% coverage of eligible women based on national guidelines.

### 4.2.5. Adult men 15+

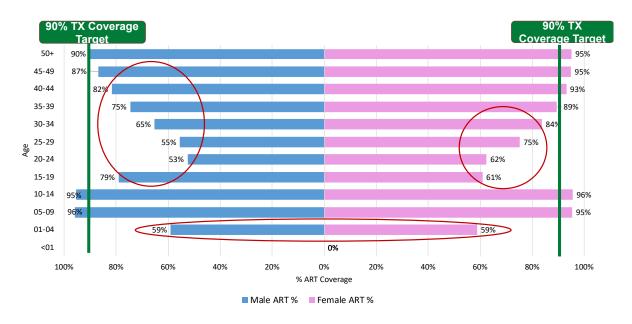

During APR20 implementation, the program's treatment growth has remained flat for adult males due to the high treatment new net losses among adult males (TX\_NET\_NEW). The FY20Q4 treatment data shows overall net gain of 2,173 males (15+) between FY19Q4 and FY20Q4. At the end of FY20Q4, a total of 78,670 males (15+) were reported to be current on treatment. Estimated viral load coverage was 84% and viral suppression rats of 97%. MMD coverage among adult men increased from 43% in FY20Q1 to 82% in FY20Q4 (see table 4.2.5.i). Community partners conducted a root-cause analysis for interruption in treatment and found 80% of them could be addressed by scaling up MMD (i.e. patients reported being away from home, travel to South Africa, being at work, and transportation

issues as primary reason for defaulting). Additionally, the FY20 delayed scale-up of optimized ART regimens like TLD contribute to low VLS, especially among males aged 15-34.

Table 4.2.5.i. MMD coverage for adult males ages 15+						
ARV Dispensing quantity	FY20Q4 Adult males receiving					
ARV Dispensing Quantity - 3 to 5 months	<mark>45,116 (55%)</mark>					
ARV Dispensing Quantity - 6 or more months	<mark>22,580 (27%)</mark>					
ARV Dispensing Quantity - Less than 3 months	11,333 (14%)					

Figure 4.2.5.ii presents ART coverage available from program data and 2019 UNAIDS Spectrum data against the 95% coverage target. Based on the recently updated UNAIDS Spectrum data, program data may underestimate ART coverage for males 15+. Lesotho's ART program data estimates ART coverage at 59% whereas UNAIDS spectrum data estimates coverage for males 15+ at 70%, with discrepancies largest among age groups 20-24, 25-29 and 30-34. However, the ART coverage for these age groups is still lower than other populations both by the ART program data and the Spectrum estimates. This calls for innovative ways to target males aged 20-34 who are being missed by the program to return to care as well as to identify undiagnosed HIV infected males.

Figure 4.2.5.ii. Adult males ages 15+ ART coverage/treatment gap

Continuity of treatment among this age group is key to achieve and sustain epidemic control and reduce new infections. For the remainder of COP20 and COP21, PEPFAR Lesotho aims to improve continuity of treatment among adult males, with special attention to ages 20-34, to greater than 95% and ensure that net losses do not account for more than 1% of the treatment program.

### **MMD**

To address barriers identified by the community root causes analysis PEPFAR Lesotho will leverage MOH and GF investments to scale up MMD and fast-track refill models adopted at facilities to improve patient experience, with an aim to achieve >90% MMD coverage for stable virally suppressed ART adult males. During COP21, the program will increase 6-month MMD coverage to 70% among adult males. To improve adherence, improve patient experience with ART and address low VLS among adult males, PEPFAR Lesotho supported the completion of TLD transition at 205 PEPFAR supported sites with 95% of PLHIV currently on treatment transitioned to DTG-based regimens in FY21 Q2. PEPFAR Lesotho will continue to track MMD scale-up and ART optimization by age and sex, with corrective actions promptly implemented. To address the low coverage, PEPFAR Lesotho will ensure that supported facilities develop and weekly track continuous quality improvement (CQI) activities focused on MMD addressing gaps identified using fish-bone root cause analysis.

#### Men's clinics

The collaborative effort between PEPFAR and MOH for establishing and scaling-up men's clinics have demonstrated convenient access to ART for adult males, peer support and stigma reduction by providing expanded hours for working males and a one-stop-center for the men's service package. Currently 36 Men clinics are active with a goal of scale-up male-friendly health care in all high and medium volume sites in COP20 and COP21. PEPFAR partners will continue to provide training to all facilities to ensure that providers are sensitized to provide adult male friendly services. PEPFAR supported sites will be required to continuously refine interventions based on feedback received from the CLM initiatives to address site specific challenges and enable providers to align interventions to the needs of the patients.

### **Facility CQI**

Interventions to address continuity of treatment at specific sites or districts will be guided by the nationally led quality improvement framework. During COP19 and COP20, PEPFAR partners have been implementing "ART documentation surge" as part of retention continuous interventions to reduce documentation issues resulting in inaccurate counts. This has already demonstrated reduction in the net losses for both females and males. PEPFAR partners will continuously refine interventions to address emerging reasons for attrition using a CQI approach, root cause analysis and community monitoring specific to retention issues for adult men. PEPFAR Lesotho will ensure that all CQI initiatives are focused on client-centered care. Promising interventions will be reviewed during monthly meetings and POART meetings with key stakeholders and considered for scale-up.

### **HRH optimization**

To return adult men back to treatment (estimated 14,000 adult men) and address other continuity of treatment gaps described above, PEPFAR conducted an HRH optimization exercise in COP20 to ensure that HRH support is aligned to treatment continuity goals and capacity strengthened for tracing and returning patients to care. Expert clients will be identified at men's clinics to provide peer counseling and promote retention. PEPFAR partners will implement interventions using the MenStar approach and framework (see table 4.2.5.iii). Staff with relevant skills working as lay counselor or focal persons will be repurposed to focus on retention and returning patients to care.

### Health data

PEPFAR Lesotho is also supporting the scale-up and improvement of eRegisters to include the pharmacy module that would address documentation issues. Supported sites will routinely identify PLHIV who do not initiate ART the same day that they were diagnosed (not linked) and those who miss appointments using appointment registers, missed appointment lists, tracking logs, and interruption in treatment reports from the Lesotho eRegister. Monitoring and reporting of tracking results into the national reporting system has previously been a challenge. It's expected that the scale-up of the eRegister with a functional shared health record (SHR) system linked with community systems will be scaled -up to support the patient tracking initiatives and ensuring that tracking outcomes are routinely used to update the treatment program report.

### **Community ART Groups (CAGs)**

CAGs enrollment will continue to be scaled-up for adult men to meet patient needs for peer psychosocial support. CAGs will be recommended specifically for virally unsuppressed males to support adherence and increase viral load suppression through peer counseling.

<b>Table 4.2.5.i</b>	Table 4.2.5.iii. COP21 retention strategies aligned to the MenStar Approach and Framework

# 4.3 Prevention, specifically detailing programs for priority programming:

# 4.3.1. HIV prevention and risk avoidance for AGYW and OVC

The OVC/DREAMS implementing partner will coordinate with other clinical partners to facilitate targeting and referrals for HTS and treatment. OVC and DREAMS programming substantially overlap; OVCs needing DREAMS services will be referred for such services, which helps to foster synergies. The caregivers or OVCs who are found positive will be linked with other OVC services such as psychological support, household economic strengthening, social grants, and other social welfare services as necessary. All these activities have increased co-location and combined service delivery with PEPFAR clinical programs, which will foster linkages to clinical HIV service providers, better connecting AGYW and OVC beneficiaries to additional HIV prevention, care, and treatment services as needed. PEPFAR Lesotho will provide comprehensive, coordinated, and youth-friendly HIV and sexual and reproductive health (SRH) services to high-risk OVC and their caregivers, and AGYW and their male partners.

PEPFAR Lesotho will manage partners and provide opportunities for improved collaboration through coordinated DREAMS and OVC meetings, DREAMS Coordinator monthly meeting with IPs, monthly targeted supportive supervision sessions, monthly Site Improvement through Monitoring System (SIMS) visits (if travel is permitted given the COVID situation and Quarterly Data Quality Assessments. These monthly and quarterly check-ins will also create platforms to share program experiences, identify programmatic bottlenecks, and map out strategies for collaboration and linkages. Creative approaches to these monitoring needs will be devised as needed during the COVID pandemic.

# **OVC**

The OVC program in COP 21, will implement the intergenerational framework, where two distinct but complementary strategies of (a)Comprehensive and (b) Preventative programming will be rolled out.

Time and resource intensive comprehensive programming will be reserved for children and their families with known high-risk characteristics especially HIV infection. For children under 2 years old who experienced interruption to treatment in PMTCT and CLHIV on treatment, the OVC program had already forged linkages with clinical partners (i.e. MOUs, bi-directional referrals protocols, shared confidentiality, case conferencing and joint case identification) and follow up at the household level will support adherence and retention. For child survivors of sexual violence, the OVC program will provide trauma counselling through an evidence-based curriculum (Trauma Informed Cognitive Behavioural Therapy), link children to statutory services (including removal by the Ministry of Social Development (MOSD) where necessary) and provide ongoing psychological counselling by MOSD professional Social Workers. Children of HIV positive FSWs will be enrolled and provided with on-going home visits. In addition, the OVC program will continue to provide Social Workers at the highest volume sites to help strengthen the bi-directional linkages between OVC IP and Clinical IP to ensure enrollment of CLHIV into the OVC program and tracking of clinical outcomes for CLHIV enrolled in the OVC program.

Primary caregivers will be identified and be enrolled in the OVC program through rigorous assessment together with children under their care in order to assist them disclose their HIV status and be provided with socio economic strengthening, nutrition, parenting and life skills building.

The second area of preventative programming will provide evidence-based violence and HIV prevention interventions to the wider community of at-risk girls and boys during the critical window between ages 9-14 in high burden areas, particularly in areas where poverty and violence are endemic. For boys and girls, the developmental period of pre and young adolescence entails unique opportunities for learning but also expose them to the increased risks including sexual violence, particularly among girls. Because this group is "at risk" but does not have known risk exposure, the OVC Preventive program approach is different from the Comprehensive Program both in intensity and longevity. The main focus for this group is evidence-based programming that prevents sexual violence, delays sexual debut, and prevents HIV. OVC and DREAMS will continue to implement the OGAC-approved HIV and violence prevention curricula - Parenting for Lifelong Health and Coaching Boys Into Men.

The OVC program will also work towards ensuring that there is integrated overlap between DREAMS and OVC for girls and young women between the ages of 10-24.

#### **DREAMS**

AGYW ages 15-24 years account for over 20% of new HIV infections in Lesotho (LePHIA 2020). There are widespread structural, social, and biological factors that contribute to the unique vulnerability of AGYW. These factors include: social isolation, economic disadvantage, discriminatory cultural norms, orphanhood, GBV, school dropout,

stigmatization, and engagement in age-disparate and/or transactional sexual relationships. There are various ministries, policy documents, and interventions that work to address sexual violence and exploitation against children.

In COP21, the DREAMS initiative will continue its implementation in the four priority districts of Maseru, Berea (Historic DREAMS districts), Mafeteng and Mohale's Hoek (Newly expanded districts). The historic DREAMS have shown significant achievement towards reaching 75% saturation. For the districts and age bands that have reached saturation targets, maintenance packages will be implemented to ensure the DREAMS' program continuity, core packages provision and epidemic control. GF will continue to implement DREAMS-like activities in the other 6 districts with increased resources focused on Leribe. Through GF catalytic funding, PACT will implement programming for AGYW and youth focused on behavior change messaging, increasing comprehensive HIV knowledge, reducing the overall numbers of AGYW who have a partner more than 10 years older, community testing, and expansion of PrEP. DREAMS will continue using the vulnerability criteria to ensure that DREAMS beneficiaries are AGYWS at highest risk for HIV acquisition through targeting those that have multiple sexual partners, experienced violence, have sexually transmitted diseases, no or irregular condom use, transactional sex, are out of school, or experienced orphan-hood. The risk assessment tool and enrollment forms will always be used to ensure that AGYW enrolled meet the vulnerability criteria.

Peace Corps Volunteers (PCVs) will undertake DREAMS-like activities in their villages in all ten districts, including: primary and secondary school-based HIV prevention and sexual reproductive health and life skills curricula, OVC parent/caregiver training, and community-based economic strengthening. In addition, PCVs support PrEP demand creation and referral activities through their Girls Leading Our World (GLOW), Youth Optimizing Leadership Opportunities (YOLO), Boys Respecting Others (BRO), and Grassroots Soccer (GRS) camps and clubs targeting adolescents.

### **Linkages and layering services**

In COP 21, there will be a greater emphasis on linkages and layering and reducing overtesting among AGYW through increased risk assessment. PEPFAR Lesotho will strengthen DREAMS linkages and referral to ensure proper layering of services from different implementing partners. This will be achieved through ensuring strong collaboration between the DREAMS partners, tracking referrals, and the use of DREAMS ambassadors. DREAMS and the OVC data system, DHIS2, will be used by all DREAMS implementing partners to monitor and report AGYW\_PREV and enhance layering through automated referrals, managing overlap between DREAMS and OVC, and tracking of both primary and secondary packages service completion for AGYW.

In COP21, the DREAMS program will pivot to enroll eligible AGYW 20-24 and provide them with the entire DREAMS primary and secondary packages, with scale-up of the socio economic strengthening activities and initiation of an education subsidy intervention.

Enhanced Economic Strengthening Approach will prepare the AGYW for employment thorough gender specific training on financial literacy, savings groups, facilitating access to and acceptance in social and business networks, and issuing starter kits for some AGYW to start small business and obtain business licenses. The program will also facilitate paid internships with ongoing mentorship and support.

The comprehensive and layered services that will be provided for AGYW (9-24 years) through DREAMS are specific to different age bands. For example, 9-14 year-old are offered risk avoidance and reduction activities to empower them against sexual violence and any form of coercive or non-consensual sex in the community, as well as efforts to prevent early sexual debut and supporting healthy choices. 15 to 19 year-old are offered condoms, HTS, school-based HIV and violence prevention, social asset building, contraceptive mix, and post-violence care; and 20-24 year old are provided condoms, HTS, contraceptive mix, combination socioeconomic approaches, PrEP, and post-violence care.

#### **PrEP**

Through DREAMS, PrEP services (added in COP17 as a core DREAMS component) in COP21 will be scaled up among AGYW ages 15-24 in Maseru, Berea, Mefteng and Mohale's Hoek. The program will continue integration of FP and PrEP services; collaboration with high schools, tertiary schools, and factories; and use of peer volunteers, community voluntary advocacy, PrEP STARS and Generation Aspire. Furthermore, the PrEP service will be integrated into safe spaces to ensure that DREAMS beneficiaries have access to PrEP services.

#### **GBV**

Lesotho, a 2014 report indicates 86% of women experienced some form of violence at least once in their lifetime, including partner and non-partner violence. In COP 21 the GBV community partner will work with the Ministry of Gender, Youth Sports and Recreation to support the development of the National GBV database system. GBV clinical partner will strengthen the integration of GBV and HIV services provision to increase the case identification across the HIV clinical cascade, particularly cases of intimate partner violence (IPV). Robust strategies to ensure that the GBV survivors are being identified and offered quality services in order to improve HIV outcomes includes; addressing IPV in the context of PrEP, index testing, and care and treatment (routine and clinical enquiry); providing post-violence clinical care services at HIV care and treatment sites; improving linkage between community-based HIV and GBV prevention interventions and clinical post-GBV care services; and improving monitoring of GBV case identification, prevention, and response activities.

# 4.3.2. Preventing Mother-to-Child Transmission (PMTCT)

The MOH with PEPFAR support continues to implement the comprehensive package of PMTCT services which follows the cascade from the first antenatal care (ANC) visit through labor and delivery until the baby is 24 months old. This includes screening and testing for HIV and rapid ART initiation for those who test HIV positive. The main goal of the PMTCT program is to achieve virtual elimination of mother-to-child transmission of HIV. Since the adoption and roll-out of test and treat policy in 2016, program data shows that about 76% of HIV infected women in ANC come with already known HIV positive status and are already on ART with most virally suppressed. The 2018 ANC sentinel survey results show a decline in positivity rate in ANC from 27.9% in 2016 to 22.8 % in 2018.

The first ANC service uptake remains high at 95%, and 76% of pregnant women have 4 ANC visits by the end of their gestation. HIV testing uptake remains high at 99%. Women who test HIV negative during their first ANC are periodically retested to rule out the possibility of sero-conversion before labor and delivery. The country will re-enforce integration of Pre-Exposure Prophylaxis for women who test HIV negative and are at risk for potential HIV infection. In COP 20, GBV services will be incorporated into the PMTCT program.

FY20 Lesotho plans to achieve >95% viral load coverage and close monitoring of PBFW and respond on time to those who are not virally suppressed. Currently the PMTCT program strives to improve viral load coverage from 37% in APR19 to >95% in APR 20. The Lesotho MOH will decentralize viral load testing for PBFW and their HIV infected children so as to reduce turnaround time of viral load results and improve timely management of patients who are not virally suppressed. Adherence to treatment will be monitored at every clinic visit. The country has adopted WHO recommendations for TLD based regimens and PBFW are included as group eligible for TLD.

#### 4.3.3. Key Populations

In Lesotho, HIV-related policies and legal frameworks do not specifically address groups at high risk, such as KP. Although these KP exist in Lesotho, epidemiological data on them are either unavailable or remain incomplete. The FSW and MSM size estimates is 2.5% and 1.96% respectively of the female and male population aged 15 – 49 years (Lesotho 2016 Census). According to the results of the Biological Behavioral Surveillance Study (IBBS2) May 2019, FSW and MSM in Lesotho have an increased burden of HIV, as compared to other adults of reproductive age. 61% to 74% of FSW and 80% to 92% of MSM reported having tested for HIV in the previous 12 months. HIV prevalence among MSM ranged from

**UNCLASSIFIED** 

<sup>5</sup> UNAIDS, 2021

7% in Mafeteng to 36% in Leribe, while FSW HIV prevalence varied from 39% in Butha Buthe to 60% in Leribe.

Technical considerations for COP21 are aimed at addressing gaps, improving efficiency, and ensuring the quality of HIV services. These include optimizing HIV testing and case finding through social and risk screening strategies. HIV self-testing will be scaled-up and social media and ICT platforms (Facebook, WhatsApp etc.) will be leveraged to reach hidden MSM networks. Additional community-based peer navigators will be recruited to enhance case finding. Enhanced peer outreach activities (EPOA) will be conducted on a routine basis across the supported districts (Leribe and Maseru) as it has shown to yield good results. The program will also expand use of one-stop-shop integrated service delivery models to other districts for improved service delivery of KP competent services and tracking of KPLHIV across the prevention, care and treatment continuum.

In COP21, the KPIF budget will be discontinued and KP program will be implemented only in the COP sites which are Maseru and Leribe. The capacity building of the CSOs will continue to be provided by PEPFAR capacity building organisations to support KP-led and KP-competent organizations for a sustainable and coordinated KP response in Lesotho.

In COP21, PEPFAR through EPIC-PACT, will support NAC to coordinate work focused on identifying and eliminating the social and structural barriers directly faced by KPs. Program approaches such as promotion of health-seeking behaviors, including consistent condom use, STI screening and treatment, regular HIV testing and access to PrEP, and treatment as prevention for KP living with HIV will continue to be implemented to ensure attainment of UNAIDS 95-95-95 targets in this population. Retention, viral load coverage and suppression will be scaled up through community VL monitoring and ART distribution to ensure a successful U=U messaging.

# 4.3.4. VMMC<sup>6</sup>

WHO/UNAIDS recommend that VMMC be offered to men, in combination with other HIV risk reduction interventions, in settings with generalized HIV epidemics and low prevalence of medical circumcision. PEPFAR Lesotho is working with the GOL to scale up VMMC coverage to 80% among males 15+ years in the five lowland districts, where there is high unmet need for circumcision and high HIV disease burden. GF resources will be leveraged for the expansion of services, recruitment of additional manpower, and procurement of equipment and supplies in the highland districts. In Lesotho, 73% of all men aged 10-29 live in the five lowland districts, and thus the strategic direction was made to focus intensive efforts and resources on these five districts.

<sup>&</sup>lt;sup>6</sup> Keeping DSD targets for the VMMC program is contingent on the approval of additional funds requested through the American Rescue Plan Act of 2021

Starting in COP20, the VMMC and community-based PrEP work is being implemented by a new partner, under a new performance-based contract. Despite significant reduction in the VMMC budget in the COP21 PLL, the VMMC program will continue to support direct-service delivery through additional funding provided approved through the ARPA funding. The focus for COP21 remains making progress towards 80% saturation in the age pivot of 15–29 year in the five districts of Berea, Maseru, Leribe, Mafeteng, and Mohale's Hoek.

In COP20, PEPFAR Lesotho will stop providing technical assistance for early infant male circumcision (EIMC) to the Ministry of Health. Traditional circumcisions, most common among men over 20 years old, have a deep-rooted cultural significance in Lesotho. Medical/traditional male circumcision collaborations with traditional initiation schools has been scaled up to ensure males with prior traditional initiation circumcision receive VMMC. PEPFAR Lesotho continues to work with traditional circumcisers in Mafeteng and Mohale's Hoek, the districts with highest prevalence of traditional circumcision.

Project implementation will leverage mobile outreach surgical trucks to scale-up services for hard-to-reach populations and in hard-to-reach areas that have shortages of medical doctors. The mobile clinic initiative will increase access and coverage of VMMC services to rural areas that do not have access to a health facility, as well as to populations such as herd boys and farmers who do not have the time to travel to a facility due to their work. Mobile clinics will be used to provide extended working hours at outreach sites and a service delivery platform to male initiates who prefer to anonymously access medical circumcision for fear of community discrimination.

Demand creation strategies will be scaled up in COP21 through sub-grants and technical assistance to the MOH to increase access to services, and include referrals from HIV testing sites and men's clinics, as well as the strategic engagement of faith-based organizations, workplace VMMC programs, and women and female community groups as champions. The program will also undertake time-limited campaigns in Mafeteng and Mohale's Hoek, where there is a high unmet need, to address the seasonal nature of demand. Program monitoring tools such as GIS and site capacity and utilization will enable teams to conduct community mapping, target community mobilization, monitor site productivity in real-time, and inform targeted demand creation among the age-pivot. The program will leverage on supporting performance based small grants/incentives to local community-based organizations for demand creation and linkages. Advocacy by community, traditional, and government leadership will also support demand creation. Peace Corp Volunteers and FBOs, working through their counterparts and with IP, will link men to VMMC services and support demand creation through girls' and boys' camps and clubs.

Given the need to achieve 80% coverage and attain sustained epidemic control in all ten districts, PEPFAR Lesotho will prioritize focused technical assistance on selected indicators to ensure quality of services and data for decision-making. Technical assistance for robust

data and service quality will involve conducting SIMS, data quality assurance (DQA), external quality assessment (EQA), and CQI on a regular basis, as well as training and mentorship of site-based M&E officers, in the areas of data management and use. Above-site partner performance monitoring online tools which include Decision Makers Program Planning 2.0 (DMPPT), Site Capacity Utilization Analysis, and Site Performance Index will be used to monitor real-time focused age pivot impact, infections averted, and associated cost savings of VMMC services.

In addition, partner performance will be tracked through high-frequency reporting and monthly site performance reports as well as mandatory quarterly performance presentations to the PEPFAR team to ensure the sites are performing at capacity. This strategy will provide a basis to refining programmatic approaches on an ongoing basis. Implementation of the online training hub modules for health care providers and community mobilizers will ensure continuous professional development and refresher trainings.

# 4.3.5 Pre-Exposure Prophylaxis (PrEP)

In COP21, PEPFAR aims to provide PrEP treatment to 24,632 new and 32,754 current on PrEP beneficiaries, which include AGYW in DREAMS districts, sero-discordant couples and PBFW across all ten districts, and key populations in Leribe, and Maseru. The GOL has branded the national PrEP program and committed to procuring PrEP medication for beneficiaries as well as guaranteed access to infrastructure, such as laboratory services. The policy has not only resulted in increased access to PrEP services, but also geographic expansion of the program.

Family planning services and PrEP for PBFW will be integrated as part of the minimum package of service delivery. Additional three community resource centers will be established in Maseru (Maseru Central and Roma) and Leribe to increase access to PrEP services especially for AGYW and KPs. Event-Driven PrEP for MSM and MMD will be scaled up to improve PrEP continuation among the beneficiaries. Step-down trainings of health care providers will continue to expand PrEP service delivery to all high-volume health centers. In addition, the program will leverage on strengthened referral linkages from HTS and HIV self-testing, VMMC, family planning, STI clinics, adolescent youth corners, and sero-discordant clinics to increase PrEP uptake. This will be achieved by transitioning the program to performance-based projects and through continued support of staff salaries, DSD, HTS, risk assessment, demand creation, and CQI. Partner performance will be tracked through weekly review reports and mandatory quarterly performance presentations to PEPFAR. Technical assistance for robust data and service quality will involve conducting SIMS 4.0, DQA, EQA, and CQI on a regular basis, as well as training and mentorship of site-based M&E officers on data management and use.

#### 4.4 Additional country-specific priorities listed in the planning level letter

# 4.4.1 Community-led Monitoring (CLM)

As PEPFAR Lesotho confronts the emerging challenges of assuring retention on life-long ART in patients who may not view themselves as sick, collaboration with communities and patients is urgent and critical. This collaboration can help PEPFAR programs and facilities ensure they are providing quality services that beneficiaries want to utilize. Collaboration with community groups, CSOs, and patients/beneficiaries can help PEPFAR programs and health institutions diagnose and pinpoint persistent problems, challenges, and barriers to effective service and client outcomes at the site level. Most importantly, this collaboration can identify workable solutions that overcome these barriers and ensure beneficiaries have access to services. CLM should be initiated and implemented by community-based organizations and other civil society groups; networks of key populations, people living with HIV and other affected groups; or other entities that gather data and observations about components of HIV services, with a focus on getting input from recipients of treatment services. Through the use of quantitative and qualitative indicators, community monitoring initiatives can monitor a wide range of issues that are associated with effective and quality HIV service delivery.

In COP21, PEPFAR Lesotho will continue to fund CLM activity through the State Department's Small Grants program in close collaboration with independent, local CSOs and host country government. PEPFAR Lesotho will make \$250,000 available to fund CLM activities. This will allow for ten small grants of \$20,000 each to be awarded to local organizations. A larger grant of \$50,000 will be awarded to a CSO for coordination and capacity building of the local organizations receiving these small grants.

In COP20, PEPFAR coordinated closely with GF to support the development of a CLM plan, with defined areas, good practices, and key indicators to monitor and provide feedback on access, acceptability, and quality of national interventions. GF developed a facility feedback tool for AGYW. In collaboration with the Lesotho MOH and CSOs, this tool was adapted for general PLHIV. COVID has delayed the identification of local organizations for this CLM activity, but implementation is anticipated to begin by June 2021. Due to limited available local organizations and CSOs that don't already implement PEPFAR programs, geographic coverage for this CLM activity may be limited.

Each grant of approximately \$20,000 would provide CLM activities to 20-25 health facilities. Each grant will specify the community councils or catchment areas to be targeted to ensure full geographic coverage. Facility feedback forms will be administered to health facilities quarterly. Local organizations who are recipients of the grants will compile the data from these scorecards and deliver the results to respective health center committees and chiefs as well as the CLM coordinating organization, who will then deliver the results to PEPFAR (through the Small Grants Office), respective district health management teams and MOH

as appropriate, CSOs, and other relevant stakeholders quarterly. Figure 4.4.1 presents the flow of information across stakeholders.

PEPFAR Information Small Grants PEPEAR Coordinating **CLM CSO** CSO Information Information Information feedforward to feedback from feedforward as health center beneficiaries appropriate through Health Center scorecards DHMTs/MOH **CSOs** Beneficiaries of Health Center PLHIS, KPS, Health Services Committees and Chiefs Relevant

Figure 4.4.1. Community-led monitoring information sharing

### 4.4.2. TB preventative therapy scale-up and TB case finding

Lesotho aims to end TB among PHLIV through a combination of widespread ART coverage, early identification and treatment of TB, TB Preventive Therapy (TPT) and effective infection control activities. TPT in combination with ART has been shown to reduce incident TB among PLHIV by up to 89%. In September 2019, Lesotho MOH's National TB Program (NTP) released new guidance on treatment of latent TB based on WHO guidance. Historically, Lesotho has been using 6-months of Isoniazid (6H), but the updated WHO guidelines endorsed the use of three months of weekly rifapentine and isoniazid (3HP/12 doses) for adults and 12 weeks rifampicin and isoniazid (3RH) for children and adolescent <15 years of age.

Stakeholders

In the past, Lesotho faced challenges including chronic stock-outs/insufficient stock for INH, health care worker attitude and patient specific intrinsic barriers that negatively impacted TPT scale-up. In COP 18, PEPFAR Lesotho conducted patient chart reviews that estimated the historical TPT coverage at 50%. The MOH has continued to proactively avail enough stocks of INH and PEPFAR supported implementing partners began a TPT surge to ensure TPT was provided for all eligible patients currently enrolled in care (see Figure

4.4.2 i). This has resulted in 176,955 adults and children currently on ART completing TPT, a cumulative completion rate of 81% as at December 31, 2020. PEPFAR Lesotho expects to reach 90% TPT coverage in COP20 and 95% TPT coverage in COP 21.

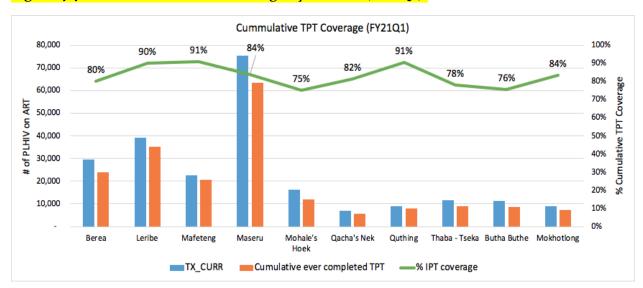

Figure 4.4.2 i: Cumulative TPT Coverage by District (FY21Q1):

During the COP 21, PEPFAR Lesotho will continue to support the implementation of the Lesotho national guidelines by procuring 3HP commodities mainly for new adult ART patients and current ART patients who may not have received TPT. PEPFAR will collaborate with MOH and GF to ensure child friendly TPT formulations are available. PEPFAR partners will continue to implement site-level CQI initiatives to address gaps in TPT data collection and reporting and ensure that MOH data collection tools and eRegister capture TPT initiation and completion. PEPFAR partners will continue to support targeted site level training for health care workers and TPT specific job aides to support implementation based on TPT specific issues identified by site. PEPFAR partners will ensure that at entry in care and subsequent clinical interactions, all patients are screened for TB symptoms before initiation and during the TPT course. This will be captured on the MOH's TB detection register or the eRegister.

In COP 21, TPT remains a core service for PLHIV and priority for PEPFAR Lesotho to ensure that we attain greater than 90% TPT coverage across all districts, age and sex groups. The MOH recognized the dynamic and unpredictable nature of the COVID-19 pandemic and has issued guidance to health facilities to ensure minimal service interruption in terms of TPT delivery. To ensure client-centered approaches, MOH recommended TPT delivery through DSD models. This recommendation facilitated dispensing of multi-month supplies that allowed PLHIV and CLHIV who had already started a TPT course to complete it without returning to the health facility. (See Figure 4.4.2.ii) The virtual patient follow-up

was provided to support adherence and monitor adverse events. <sup>7</sup> PEPFAR clinical and community partners will ensure treatment literacy about TB symptoms and TPT side effects to enable less frequent clinical visits.

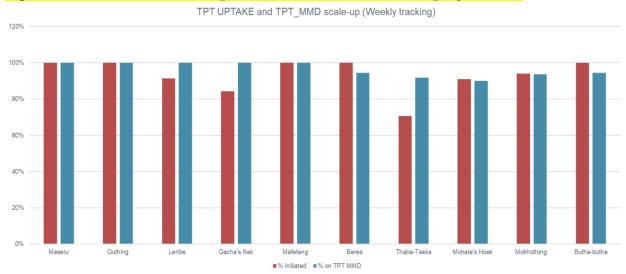

Figure 4.4.2.ii Lesotho TPT Uptake and TPT MMD scale-up by district

Lesotho has one of the world's most severe epidemics of tuberculosis (TB) and HIV, with an estimated TB incidence (including HIV/TB co-infection) of 611 per 100,000 population (13,000 incident TB cases, out of which 8,400 are estimated to be TB and HIV co-infected). Lesotho has recently completed its first TB prevalence survey and results will be available in COP2020. Lesotho has committed to the End TB strategy and United Nations High-Level Meeting on TB (2018) targets and the GOL has policies in place to address TB and TB/HIV epidemics.

Throughout COP19/COP20, PEPFAR Lesotho has been committed to support the MOH/NTP's "Effective TB Case Finding Strategies (ECFS) and Standard Operating Procedures (SOP) to Improve TB Case Detection in Lesotho". PEPFAR Lesotho with ensure that its investments at site level, district/DHMT and above site are directed to address identified gaps including sub-optimal TB screening activities at facility and community, underdiagnosis among children, major leakages across the TB diagnostic cascade, and poor TB treatment outcomes. During COP21, PEPFAR Lesotho will continue to support NTPs efforts for active TB case finding leveraging MOH's recently acquired mobile units with digital x-rays to enhance TB screening and optimal diagnosis.

PEPFAR Lesotho will review the TB program data for last 24 months, triangulating it with the TB prevalence findings to map hot spots for TB and direct TB case finding interventions to these areas. PEPFAR Lesotho will integrate index testing activities with TB contact tracing and defaulter tracing to provide more efficient TB/HIV services. During COP19/COP20 PEPFAR Lesotho is conducting a human resource optimization excise to identify and plug all leakages in the TB diagnostic cascade with the appropriate skilled personnel and resources. PEPFAR will continue to support nurses at ART or TB clinics to ensure TB/HIV interventions are implemented with fidelity and to scale.

As Lesotho reaches epidemic control, some of the lay counselors will be repurposed for TB contact tracing, documenting the TB detection cascade at facility and in the community. At the national level, PEPFAR Lesotho will continue to support national strategic positions (TB/HIV technical advisors and TB strategic information staff) to strengthen TB/HIV management at district and site levels, train and mentor healthcare workers, and support data quality improvement for TB indicators. In addition, PEPFAR Lesotho will provide TB diagnostics support (GeneXpert cartridges GXP, cartridges, DST, TB-LAM), support TB diagnostics optimization, TB strategic information for TB (operational research, TB indicators, TB score card), guidelines development, job aides, and support supervision.

# 4.4.3. Implementation of Advanced HIV Disease package

In COP 21, PEPFAR Lesotho continued to be committed to reducing mortality for PLHIV by providing differentiated service delivery for patients with advanced HIV disease (AHD).

The study "Implementation and Evaluation Differentiated HIV Care and Treatment for People with Advanced HIV Disease in Lesotho" conducted in two district hospitals, Berea Government Hospital and Motebang Hospital during FY19/20 aimed at strengthening the program for PLHIV with advanced disease in Lesotho by training clinical providers and laboratory staff on the WHO recommended package of care for PLHIV with advanced disease, and implementing a differentiated care model. Advanced HIV Disease is defined as: PLHIV with CD4 < 200 cells/mm3 or in WHO Clinical stage 3 or 4 (applies to adults, adolescents and children ≥ 5 years of age). The WHO AHD package includes: (a) rapid initiation of ART (if there are no contraindications to ART initiation); (b) screening for cotrimoxazole prophylaxis; (c) screening for active TB disease and prompt initiation of anti-TB treatment or TPT as indicated; (d) systematic screening for CrAg; and (e) intensive follow-up.

The prevalence of AHD among newly enrolled ART patients was estimated 28%, 51% had a CD4 of less 100 (CD4 results were available for 65% of the study participants) and mortality was estimated at 10%; males accounted for 57% of the patients with AHD. Critical gaps identified that will be addressed in COP19/COP2020 include lack of critical commodities for AHD package (stock outs of CD4 reagents, GXP cartridges, CrAG test, stock out for basic tests like renal function tests, stock-out of critical pharmaceutical commodities like

Amphotericin B and Fluconazole). Health care capacity for clinical, laboratory and pharmacy staff to manage AHD was also identified as critical gap.

For COP19/COP2020 PEPFAR Lesotho leveraged other investments from MOH, the Clinton Health Access Initiative (CHAI) and GF to implement the WHO recommended AHD package. PEPFAR Lesotho will specifically support the development and training of multidisciplinary health care workers on the MOH's AHD manual, mentorship of health care workers, and development of related job aides such as the algorithm for providing a package of care for people with AHD. To manage risk of AHD in children, PEPFAR Lesotho is also providing support to the pediatric case finding and ensure that all children < 5 years are started or transitioned to more optimized/effective regimens.

In COP2021 PEPFAR will support the MOH's health AHD phased scale-up of the AHD management package to the 19 hospitals and eventually to all the lower health units including continuous quality improvement activities for AHD. This support focusses on the theme to STOP AIDS which in brief includes (1) Screening for opportunistic infections like TB, cryptococcal meningitis, (2) Treat all opportunistic infections like TB and cryptococcal meningitiotis (3) Optimize ART which focuses on rapid initiation of optimized ART regimens for both Children and Adults and (4) Prevent opportunistic infections through provision of TB Preventive Therapy, fluconazole and cotrimoxazole for all eligible PLHIV.

# The COP2021 Advanced HIV Disease priorities will include:

- Training clinical providers (multidisciplinary cadres) on the WHO recommended package of care for PLHIV with advanced disease including the Lesotho AHD Manual and related job aides.
- Availability of related lab commodities including CD4 reagents, Cryptococcal antigen testing, LFLAM test (urine-based TB test), Xpert MTB/RIF Ultra and ensuring Optimization of Lab equipment/platforms across the country.
- Ensuing availability of necessary pharmaceutical equipment in collaboration with key players like MOH, Global Fund and CHAI) These commodities include TPT(INH/3HP), Fluconazole, Flucytosine, liposomal Amphotericin, etc.
- Patient follow-up and monitoring through a standardized visit schedule (First visit, Week 2 Month 1, Month 3, Month 5, Month 6 (milestone VL Sample collection) and patient centered approaches

PEPFAR Lesotho will continue to support the strengthening of M&E reporting processes for AHD through updating eRegisters and related reporting tools. PEPFAR Lesotho is also providing support for viral load monitoring that is the primary method for monitoring response to ART.

PEPFAR Lesotho will leverage key MOH and GF heath systems investments like optimization of CD4 testing instruments including centralized CD4 testing and point of care based testing, basic tests like the full blood count, renal function tests and liver function tests that are critical for the management of patients with AHD. PEPFAR partners will ensure that all cotrimoxazole prophylaxis is prescribed for all eligible adults and children.

PEPFAR clinical implementing partners will routinely be assessed during program monitoring visits, SIMS and will be required to report monthly on the implementation of AHD package in the supported sites. PEPFAR will also track availability of critical commodities for AHD package implementation at national, DHMT and site level.

#### 4.4.4. HIV Drug Resistance surveillance

The LePHIA 2016-17 estimated the transmitted resistance to ARVS in Lesotho at 11.4% with most mutation conferring resistance to non-nucleoside reverse transcriptase inhibitors (NNRTIs). During COP18, PEPFAR Lesotho supported an HIV Drug Resistance survey through a CDC centrally supported mechanism. This was a nationally representative survey of acquired HIVDR in adults. Viral load suppression (defined as viral load <1000 copies/ml) among adults on ART was 93.4% in people on ART for 12 months and 92.1% those on ART for 48+ months. Preliminary analyses show a survey weighted prevalence of any HIV drug resistance among patients on ART of 3.23% and 6.9% amongst people on ART for 12 and 48+ months, respectively. All detected mutations were associated with resistance to reverse transcriptase inhibitors, and no PI resistance was detected among survey participants in both groups. The prevalence of NNRTI and NTRI resistances among individuals on ART with viral load ≥1000 copies/ml was significantly higher in those on ART for 48+ months (NNRTI: 88.7%, and NRTI: 79.7%) compared to those on ART for 12 months (NNRTI: 49.8%, and NRTI: 27.4%). The MOH in collaboration with Baylor also conducted a pediatric acquired HIVDR survey estimated in children receiving ART, results may available before the end of COP20.

Lesotho has scaled up the DTG-based regimen to all eligible adults and children above 35kg. In COP21, Lesotho will continue to scale up DTG-based regimens to all eligible adults and children weighing >3kg, with the pediatric DTG 10mg dispersible tablets provided as a new formulation in this fiscal year. DTG has a high barrier to HIV drug resistance HIVDR) and therefore virological failure among ART naïve patients is very rare. Lesotho is using TLD for both first- and second-line regimen. PEPFAR-supported HIVDR surveillance activities will mainly focus on patients failing on TLD. Samples for monitoring TLD resistance may be obtained from the viral load labs already established in the country and follow the applicable ethical procedures. PEPFAR Lesotho will no longer support conducting NNRTI based regimen surveillance, as Lesotho has already established prevalence and pattern of NNRTI related HIVDR.

# 4.4.5. Recency Testing/Case-based Surveillance

In COP<sub>18</sub>, Lesotho integrated recent infection testing into routine HIV services to detect, characterize, monitor, and intervene on recent infections among newly diagnosed PLHIV. This began in a phased approach with 24 sites under the Motebang hospital catchment area. Implementation started in August 2019 and results are reviewed every week at the TRACE Lesotho dashboard.8 Results indicate approximately 20% recent infection among the newly diagnosed with the highest burden of new infections occurring among the 15-24 aged females (see figure 4.4.5.i).

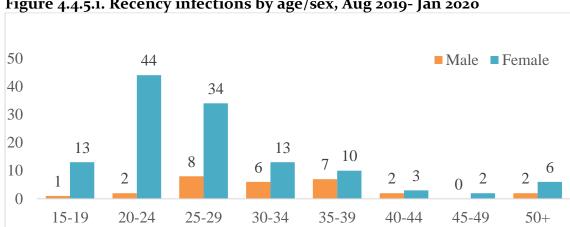

Figure 4.4.5.i. Recency infections by age/sex, Aug 2019- Jan 2020

In COP20, Lesotho planned phased national scale-up of HIV Recency testing. Due to the COVID\_19 restrictions in group gatherings and travel and pauses in non-essential clinical services, trainings and site visits for activation, monitoring, and quality assurance activities for recency testing, a decision was made to pause recency testing in April 2020. As of April 2021, recency activities at the site level are still paused (see figure 4.4.5.ii).

Figure 4.4.5.ii Impact of COVID-19 on Recency Scale-up

<sup>&</sup>lt;sup>8</sup>DHIS<sub>2</sub>, <a href="https://dhis-ls-trace.org/dhis-web-dashboard/">https://dhis-ls-trace.org/dhis-web-dashboard/</a>

For COP 2021 PEPFAR Lesotho recency scale-up remains prioritized as Lesotho approaches epidemic control and the pandemic situation improves in Lesotho. PEPFAR Lesotho acknowledges that rapid scale-up may compromise the quality of the recency test performance, data quality and interpretation challenges. During COP 21, PEPFAR Lesotho will continue to focus on a phased scale-up ensuring that all required components are available before site expansion to assure quality and meet 100% recency testing for all newly identified HV positives. PEPFAR Lesotho in collaboration with MOH, CDC HQ staff, and implementing partners will ensure training of trainers on recency testing to develop a pool of experts for scale-up that will be responsible for the step-down trainings and certification of testers/test providers. PEPFAR Lesotho will procure the required recency test kits for implementation and provider training and support recency monitoring activities to ensure quality of testing and test performance. In COP2021, PEPFAR Lesotho will also integrate viral load (VL) results into recent infection testing algorithm (RITA) to verify accuracy of recency status of individuals testing recent on RTRI as per Lesotho's revised recency implementation protocol.

PEPFAR Lesotho will continue to work with CDC HQ, MOH and WHO on steps required for full integration of recency testing within the HTS program, including integrating recency testing in the official national HTS algorithm. In addition, PEPFAR Lesotho will work with MOH and relevant stakeholders to ensure recency data can be captured by the MOH HTS data collection tools such as the eRegister. In COP21, PEPFAR Lesotho will host virtual recency data use workshops for stakeholders to review compiled recency data on a dashboard; disaggregated by gender, age, geography, and other key variables; show plausibility of recent infections based on epidemiology of transmission patterns in the country; and develop cluster response plans for specific hot spot.

Recent infection surveillance implementation is a collaborative effort including PEPFAR partners, MOH, and CDC. The CDC centrally-funded mechanism Tracking with Recency Assays to Control the Epidemic (TRACE) will provide technical assistance for CQI to ensure the quality of recency surveillance data, support development of national policy and guidance, provide training of trainers, develop dashboards for real-time review, and develop recency cluster strategies and other activities identified by the country team. PEPFAR partner management during program monitoring visits, calls and monthly/quarterly meetings will focus on real-time aggregate recency data, coverage of recency testing for supported sites, identifying quality related issues, root cause analyses, and taking corrective actions in a timely manner to strengthen program performance. Reviews of expenditure quarterly will ensure that the program is being implemented cost-effectively.

#### 4.5 Commodities

# 4.5.1. Commodities procurement and security

To scale-up HIV care and treatment services and achieve epidemic control, an uninterrupted supply of ARVs and HIV diagnostic and monitoring commodities is critical. In addition, TPT, VMMC and PrEP commodities remain vital to ensure that patients don't contract TB and new HIV infections are averted.

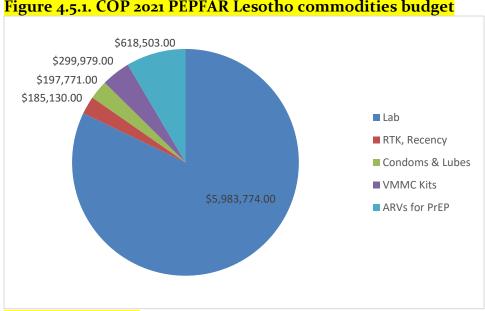

Figure 4.5.1. COP 2021 PEPFAR Lesotho commodities budget

Source: PEPFAR COP21 FAST

Figure 4.5.1 shows the COP 2021 commodities budget that PEPFAR has committed towards the HIV response in Lesotho. In FY22, PEPFAR Lesotho will spend \$ 7,285,157 to support procurement of laboratory commodities, VMMC kits, and HTS commodities. PEPFAR has allocated sufficient funds for laboratory commodities to cover 75% of VL monitoring, EID, and TB diagnosis needs in the 10 districts. ARVs and rapid diagnostic test kits (RTKs) will be funded by GF and MOH. GF will also support 25% of the laboratory commodities requirements to cover all sites in the 10 districts of Lesotho.

In FY 20, PEPFAR Lesotho's collaboration with the MOH, GF, Roche, Cepheid and other development partners to develop a strategy and plan to ensure commodity security resulted in no reported stockouts of laboratory reagents and consumables. In FY21, PEPFAR supported implementation of Service Level Agreements (SLA) with VL and EID lab commodities through reagent lease agreement with the vendors (Roche and Hologic) using the global pricing. This significantly reduced the stock outs and machine breakdown thereby allowing us to increase our VL coverage. In COP21, the plan is to include Cepheid for GeneXpert and other integrated testing services.

The GHSC-PSM program has provided technical assistance for contract management practice within the SCMD to enhance commodity contract performance using key performance indicators (KPIs). In COP21, the GHSC-PSM will continue to monitor inclusion of KPIs or delivery milestones and accountability processes both at the central and local level

The DSD provided by the district logistics officers (DLOs) has had an impact on commodity visibility and requisition orders from the site level to the central medical stores through the Informed PUSH, a supply chain management report and requisition tool integrated within the DHIS II where site level staff input information such as stock-on-hand and dispensed-to-user data. The Informed PUSH was developed to assist frontline staff manage their inventory control system for HIV tracer commodities, saving time on commodity calculations. This support provided by DLOs will continue in COP 21. Another high-level achievement in FY 20 is the official establishment/gazetting of the SCMD.

PEPFAR Lesotho will continue to coordinate with GF and MOH to ensure that there is an adequate budget and commodity stocks in order to attain 95-95-95 across all the 10 districts in Lesotho. PEPFAR through the GHSC program will continue to support the Supply Chain Management Technical Working Group (SCM-TWG) and its sub-committees to ensure that annual and bi-annual forecasting and supply planning activities for HIV commodities continue to be implemented as planned. The GHSC project teams are well positioned with their forecasting and quantification tools (Pipeline and QuantiMed) to complete the needed analysis to fill in supply plans for all HIV and AIDS tracer commodities.

Table 4.5.1 FY 2021/2022 Commodities Budget for MOH, PEPFAR & Global Fund				
Commodity	МОН	Global Fund	PEPFAR	Totals
ARVs-Adult + Pediatric	\$ <mark>21,642,012</mark>	\$2,090,516	<b>\$</b> 0	<mark>\$23,732,527</mark>
ARVs for PrEP	<mark>\$741,335</mark>	<b>\$</b> 0	\$618,503	<mark>\$1,359,838</mark>
HIV Test Kits	<b>\$</b> 0	\$574,461	\$185,130	\$759,591
Condoms and lubes	\$o	<mark>\$0</mark>	<mark>\$197,771</mark>	<mark>\$197,771</mark>
Self-Testing Kits	<b>\$</b> 0	\$245,800	<b>\$</b> 0	\$245,800
TPT Commodities	<b>\$</b> 0	\$776,130	<b>\$</b> 0	\$776,130
Laboratory commodities	\$1,216,281	\$706,756	\$5,983,774	\$7,906,811
VMMC kits	<b>\$</b> 0	\$61,965	\$299,979	\$361,944
Essential Medicines & Supplies	\$5,110,758	\$0	<b>\$</b> 0	\$5,110,758
Grand Total	\$\$28,710,386	\$4,455,627	\$7,285,157	\$ 40,451,170

Source: GF Year 1 budget 2021, MOH budget 2021, PEPFAR COP21 FAST

Table 4.5.1 above shows the Commodities budget for the most critical HIV tracer commodities including essential medicines and supplies are currently only supported by the MOH. The total HIV commodities budget for FY 20–21 is \$40,451,170 (LSL \$592,609,655). The table also shows that the budget has adequately catered for TPT (by GF), self-testing (by GF), VMMC, PrEP, ARVs optimization and laboratory reagents and consumables. PEPFAR will collaborate with both MOH and GF to ensure that commodity procurements are well coordinated using the National Commodities Supply Plan managed by the SCMD and with technical assistance from the GHSC-PSM. Based on the October 2020 commodity forecasting and quantification, this budget is adequate to support all HIV interventions and the associated COP 21 targets.

During discussions at the Regional Planning Meeting, GF confirmed their commitment to purchasing additional TPT commodities, therefore PEPFAR will not be purchasing any TPT commodities going forward.

In anticipation of possible stock outs, PEPFAR has allocated buffer-stock funds for test kits (HIVST) and ARVs (PrEP medication (TDF/3TC)) as a stopgap measure. The buffer stock will be distributed once NDSO TDF/3TC stocks are below minimum stock-levels (less than 3 month of stocks). Through the CDC cooperative agreement, resources have been allocated to the MOH to procure laboratory reagents and supplies for VL, EID, and TB diagnosis for all the 10 districts in Lesotho. PEPFAR has also budgeted for recency testing and VMMC commodities.

#### 4.5.2 TLD Transition

Optimizing antiretroviral regimens can increase access to treatment and improve outcomes through impact on treatment adherence, viral suppression, and quality of life for PLHIV. This can increase the speed at which 95-95-95 targets are achieved. Dolutegravir (DTG) has been shown to be superior regarding efficacy, genetic barrier to resistance, tolerance, and treatment discontinuation from adverse drug reactions compared to Efavirenz and boosted protease inhibitors. In addition, the fixed dose combination (FDC) of Tenofovir Disoproxil Fumarate/Lamivudine/Dolutegravir (TLD) is currently priced as the least expensive FDC.

Beginning November 2018, the MOH has led the revision of the ART treatment and prevention guidelines, in line with the WHO recommendations, and revised the adult first-line treatment regimen from TLE to TLD. In addition, the MOH has also revised the regimens for pediatrics to include Lopinavir/ritonavir pellets/granules (LPV/r) for children <20 kg, DTG50 for children >20kg, and TLD for children >35 kg. The MOH has shown political commitment and transitioned approximately 219,322 of PLHIV in Lesotho from Nevirapine and TLE regimens to TLD as at Feb 2021.

In order to ensure that the ARV Optimization and TLD transition occurs, the MOH has committed to phase-out both pediatric and adult Nevirapine regimens by end of April 2020.

Both GF and MOH have provided resources to fund ARV supply plans that align with the new optimized regimens for pediatrics, adolescents, and adults in their FY 2020 to 2021 budgets.

#### 4.6 Collaboration, Integration and Monitoring

In the past few years, there has been progress made in collaboration, integration, and monitoring. PEPFAR agency leads and the Principal Secretary of Health have monthly meetings to discuss key topics that need MOH or agency leadership to advance them and provide both parties an opportunity to discuss programmatic shifts or challenges. These meetings afford the opportunity to jointly discuss collaboration among donors, provide a closer view into PEPFAR priorities, and ensure alignment within the GOL strategic framework.

The quarterly POART stakeholder meetings have been very well-attended by MOH colleagues, IPs, civil society, and various other in-country stakeholders. These meetings provide the Lesotho HIV stakeholder community as well as the entire PEPFAR team an opportunity to discuss the PEPFAR program. The POART meetings have increased data quality and transparency, as well as knowledge about the PEPFAR program priorities, targets, and results.

In Lesotho, PEPFAR plays a key role in national HIV coordination. PEPFAR and UNAIDS co-chair the monthly AIDS Development Partner meeting. This forum allows all HIV stakeholders in Lesotho an opportunity to learn about the work being done by other partners, capitalize on opportunities for collaboration, and provide technical input into Lesotho's HIV programs and results. This monthly meeting has been suspended in COP20, but will be expected to resume once it is deemed safe to meet in person again.

PEPFAR is an active member of the Lesotho Country Coordinating Mechanism (CCM), and in particular, the Oversight Committee for GF. PEPFAR participation in these committees is key to ensuring joint planning and program coordination between the two largest donors.

Internally, PEPFAR Lesotho holds monthly meetings with their IPs that allow the team to track progress between quarterly reporting periods and improve data quality by allowing questions and concerns to be flagged. These IPs meetings are open to the entire PEPFAR team and are an opportunity for agencies to learn about and ask questions about each other's programs and performance. The IP meetings also provide an opportunity for the activity managers to provide technical assistance and guidance to IPs to improve their implementation of critical programmatic activities. The agency activity managers have near daily interactions with partners by phone, e-mail, and/or in-person meetings and weekly reporting on key MER indicators by the clinical partners. PEPFAR Lesotho is working very closely with our new, local partners and have two dedicated partners to provide specific,

tailored training and capacity building support in the areas of technical programming and organizational capacity. USAID also has begun a new system of high frequency reports that are submitted monthly and help monitor the minimum program requirements to discuss challenges and improve partner performance. CDC has implemented a system requiring quarterly spend plans and expenditure reports from their partners to help observe where activities have been delayed or changed due to the current COVID pandemic environment. This system also allows activity managers to provide inputs to IPs on where alternative strategies can be implemented to ensure partners are still able to achieve their program objectives and targets.

SIMS is another key component of PEPFAR Lesotho program monitoring. SIMS are done monthly and PEPFAR Lesotho ensures that all sites get visited at least once a year. There are also quarterly DQAs to ensure that site level data is complete and accurate. In combination with SIMS, PEPFAR Lesotho conducts routine site monitoring visits to take a more comprehensive look at challenges, help identify best practices, and address gaps in the clinical cascade. Beginning in March 2020, SIMS activities were largely suspended, but are expected to resume again by the start of COP21.

All high-level COP planning is done as a joint interagency team. With the exception of Peace Corps, PEPFAR Lesotho sits together in one building, with agency staff intermingled throughout the office.

To ensure implementation of innovative strategies across the cascade, PEPFAR Lesotho is enhancing site level mentorship and training to enable rapid policy adoption and service quality using multi-disciplinary district-based teams. The program is focusing on the minimum programming requirements at high volume sites that include index testing, MMD, VL monitoring, TPT uptake & completion, and adult & pediatric ART optimization. PEPFAR Lesotho has institutionalized weekly site level performance reviews by site-, district-, and IP-levels to ensure proactive scale-up of PEPFAR care and treatment cascade priorities for linkage, continuity of treatment, and viral suppression for all PLHIV. These reviews enable real-time course correction and ensure staff at all levels are jointly accountable for performance results. The COP21 cascade interventions that will undergo enhanced monitoring to ensure scale up with fidelity include expansion of differentiated service delivery, (including MMD), sustaining linkage proxy to >95%, and proactive tracking and re-engaging the LTFU back in to care to maintain treatment growth trends.

The PEPFAR program will continue to support the inter-partner collaborative efforts to strengthen optimization of key health system-related interventions that are critical to bridging cascade gaps. Specifically:

 The clinic-laboratory interface will provide opportunities to review whether site level demand for VL, EID, and TB/GeneXpert services meets the national testing capacity, turnaround time of results, and ensuring all sites meet the national QA/QC standards for HIV testing services.

- The collaboration of the clinical and supply chain partners will be strengthened to meet the
  demand for differentiated service delivery, ART optimization to more efficacious regimens
  and formulations, and bidirectional feedback on course corrections in cases of stock-outs
  or delayed commodity ordering
- PEPAR/Lesotho will continue to support the MOH in the roll-out of the eRegisters and utilization of the unique identifiers along the prevention and clinical cascades.

To improve quality and efficiencies of service delivery, continuous quality improvement will be integrated in all service outlets to ensure client-centered services are scaled up at community and facility levels. The program will support the training of service providers on CQI principles, develop QI projects based on prevailing programming gaps, and foster district level learning forum to share best practices that can be implemented to scale. During COP20, at least 90% of PEPFAR-supported sites will have a functional site QI team whose membership will be composed of facility and community level service providers.

Program efficiencies will continue to be fostered through implementing partner rationalization, provision of integrated services, and differentiated service delivery to increase case identification, linkage, retention, and treatment outcomes for underserved populations (e.g. flexible working hours on weekends for children and adolescents in school, and one-stop shop service outlets for men).

During COP21, the community-led monitoring of treatment services will target sites in the lowlands to gauge whether providers at existing health systems offer rights-based, client-centered quality care that directly contributes to improved treatment outcomes. Community-based organizations and civil society will provide feedback from program beneficiaries to health unit management committees, PLHIV, Ministry of Health, PEPFAR, GF, and other stakeholders.

The eRegister is in use in 178 health facilities in Lesotho that provide care for 90% of all people on treatment in the country. At the facility level the eRegister generates a unique ID as part of the registration process. This ID is linked to personal attributes and also has a facility code and serial number. In each person's record there are also fields for their National ID and ART number. At the national level the health information exchange (HIE) on the OpenEMPI client registry system generates a unique ID when the client is registered creating a global ID that matches their attributes. The HIE was activated in all health facilities utilizing eRegister in late 2020.

# 4.7 Targets by population

The targets for the following three tables have been generated from COP21 Data Pack and relevant Program data.

Table 4.7.1 ART Targets by Prioritization for Epidemic Control						
Prioritization Area	Total PLHIV	Expected current on ART (APR FY21)*	Additional patients required for 90% ART coverage	Target current on ART (APR FY22) TX_CURR	Newly initiated (APR FY22) TX_NEW	ART Coverage (APR 22)
Attained						
Scale-Up Saturation	279,030	245,327	35,275	255,603	10,643	92%
Scale-Up Aggressive						
Sustained						
Central Support						
Commodities (if not included in previous categories)						
Total	279,030	245,327	35,275	255,603	10,643	92%

<sup>\*</sup>Shadow target was developed based on the de-facto population estimate to facilitate the better evaluation of FY21 PEPFAR performance.

Table 4.7.2 VMMC Coverage and Targets by Age Bracket in Scale-up Districts					
SNU	Target Populations	Population Size Estimate (SNUs)	Current Coverage (FY20)	VMMC_CIRC (in FY22)	Expected Coverage (in FY21)
Lesotho	Age of Focus: [15-29]	208,682	58%	20,219	80%
	Total/Average	208,682	58%	20,219	80%

Source: DMPTT2 tool, 2021 for coverage data, Defacto Census population data 2020 for target population

Table 4.7.3 Target Populations for Prevention Interventions to Facilitate Epidemic					
Control					
<b>Target Populations</b>	Population Size Estimate (SNUs) and disease burden	Coverage Goal (in FY22)	FY22 Target		
AGYW (10-24 years old)*	95.270	61%	58,178		
KP_PREV**	7,712	86%	6,599		
PP_PREV <sup>†</sup>	726,608	30%	219,754		
TOTAL	829,599	34%	284,517		

<sup>\*</sup>AGYW population calculated based on the percentage of vulnerable children from the VAC Survey 2018 and includes AGYW in Berea, Maseru, Mefteng and Mohale's Hoek.

\*\* KP size estimate for FY22 in Leribe and Maseru only.

<sup>†</sup>Priority population size estimate is based on OVC target population, AGYW, children age 5-14, and the client of FSW including military and taxi drivers.

Table 4.7.4 Targets for OVC and Linkages to HIV Services			
Estimated # of Orphans and Vulnerable Children*	Target # of active OVC (FY22Target) OVC_SERV	Target # of active beneficiaries receiving support from PEPFAR OVC programs whose HIV status is known in program files (FY22 Target) OVC*	
197,599	95,426	52,571	

<sup>\*</sup>The above figure includes the OVC caregivers who are also the target of OVC program intervention.

# 4.8 Cervical Cancer Program Plans

Cervical cancer is a major public health problem in Lesotho, ranking 8th in the top 20 global high-burden countries. Cervical cancer is the most frequent cancer among women aged 15-44 years and is a leading cause of death from cancer among women in Lesotho. The age-standardized incidence rate was 52.1 per 100,000 in 2018. Every year approximately 477 women are diagnosed with cervical cancer and 346 die from the disease. Lesotho has significant programmatic gaps in the uptake of cervical cancer services with only 47% of women aged 15-49 years having heard of cervical cancer screening and only 4% having had a screening test in the past 12 months (LDHS, 2014). WLHIV have a four-five times higher risk of developing cervical cancer compared to HIV negative women.

The PEPFAR Lesotho goal is to scale up services for secondary prevention of cervical cancer as a strategy to reduce morbidity and mortality among WLHIV aged 25-49. This initiative builds on existing health systems to increase access to cervical cancer screening services, treatment of precancerous lesions, and timely referral of women who screen positive for invasive cancer to the national referral hospital or to South Africa. To attain this goal, the PEPFAR Lesotho program is providing technical support to the MOH to update national cervical cancer clinical guidelines, job aides, training manuals, and M&E tools. Capacity building to improve the knowledge and skills of national, district, and site-level staff is being offered through on-site trainings, clinical attachments to the Senkatana cervical cancer center of excellence, and on-going mentorship.

The "screen and treat" cervical cancer services will be provided in all high and medium-volume sites for WLHIV aged 25-49 years. Eligible WLHIV are screened within the ART and MNCH clinics using visual inspection with acetic acid (VIA), which is the primary screening method. Treatment for precancerous lesions is offered through the use of cryotherapy/thermo-coagulation and LEEP. During COP18, the PEPFAR Lesotho program established three additional LEEP centers (Queen II, Motebang and Mafeteng Hospitals), making a total of four LEEP centers, including Senkatana. Screen and treat services were enhanced through procurement of equipment and supplies, building on existing national stocks that are provided by the MOH.

During COP21, the PEPFAR Lesotho program will build on these gains to expand cervical cancer screening services to 50,888 WLHIV aged 25-49 years, which reflects 50% of the current on treatment (TX\_CURR) target in this age group. PEPFAR Lesotho will continue to strengthen the national policy framework to ensure alignment to WHO and PEPFAR guidelines for cervical cancer, build the capacity of district and site-level service providers, institutionalize quality

improvement and quality assurance as a core service package, and support histopathology examination of LEEP specimens. The PEPFAR Lesotho program will continue to leverage GOL resources to improve treatment uptake by using thermocoagulation. Site, district, and partner-level performance reviews will be conducted through monthly progress reviews, site-level visits for programmatic monitoring, and SIMS visits.

#### 4.9 Viral Load and Early Infant Diagnosis Optimization

PEPFAR will continue providing comprehensive technical support to ensure timely and quality-assured TB/HIV diagnosis and patient monitoring services that will contribute to achieving epidemic control and attaining 95-95-95 targets. The support includes, but is not limited to, specimen transport, referral testing, results delivery, procurement and distribution of laboratory commodities, and continuous quality improvement.

In COP21, the technical support will focus on completion optimization and integration of both conventional and point of care (POC) instruments to scale up VL, EID, TB and COVID-19 testing and ensure demand is met. In partnership with MOH and implementing partners, guidance and specific requirements including staff deployment, equipment placement, and VL/EID/TB reagent contracts will be fully implemented and/or strengthened with key performance indicators in place. The implementation and completion of diagnostic network optimization and integrated services is expected to improve quality, efficiency and cost-effectiveness.

The program has mapped instruments and laboratory network with capacity and utilization. Specimen transport and laboratory network optimization is already operationalized since FY20. Lesotho is using 7 Roche, 1 Hologic Panther, 15 Abbott m-PIMA and 63 GeneXpert (61 GX-IV and 2 GX-VIII) instruments. The POC-EID instruments (15 Abbott-PIMA and 14 GeneXpert-IV) that were rolled out separately have now been optimized and integrated across the program to support multipurpose testing services. With full implementation of laboratory network optimization, the unmet need will be addressed with no additional placement of new instruments. The provision of optimized and integrated VL, EID and TB testing services will allow the laboratory and clinicians to use comprehensive information for informed decision making and effective patient care.

# <u>Scaling up of Viral Load (VL) monitoring services</u>

By the end of FY21, VL monitoring is expected to cover 95% of eligible PHLIV on ART while in COP21, the coverage will increase to 100%. The strategies to achieve the targets include optimization of platforms, specimen transport, further decentralization of testing services, web-based timely result reporting, routinely monitoring performance, and improving quality of integrated testing services.

To increase the capacity of testing outputs by 30%, low throughput Roche instruments from two VL laboratories have been be replaced with high throughput instruments (2)

cobas-4800). In addition, 1 Hologic Panther with high throughput is operational at the National Reference Laboratory as of April 2021. The terms and conditions for instrument/reagent rental agreement have been revised to monitor performance of the service provider. DBS VL will be also scaled up to improve access to hard-to-reach areas where whole blood specimen collection and transport services are challenging or POC VL testing services are not provided.

The reference and all clinical laboratories will optimize the use of LIS to improve data flow between laboratories and health facilities and strengthen VL dashboard to support data analysis and visualization at the national level. SMS messaging and notification of patients and web-based result transmission (e-reporting) using LIS and DHIS2 will be scaled to all health facilities. This will substantially reduce turnaround time to less than 2 weeks, improve VL management and enhance adherence and counseling of ART patients whose VL are not suppressed.

Access to VL testing and prompt action for unsuppressed VL among pregnant and breastfeeding women (PBFW) is important to prevent mother-to-child transmission of HIV. In implementing POC-VL, guidance, protocols, and specific requirements including staff training, laboratory validation and biosafety are completed. POC VL testing service has already been piloted in five sites. This will be scaled up in additional health facilities where conventional testing services are not accessible and time-sensitive monitoring cannot be provided to PBFW and virally unsuppressed patients. Both GeneXpert and mPIMA platforms will be used for scaling up POC VL testing services.

With VL platform optimization and continued monitoring, PEPFAR Lesotho anticipates achieving 100% VL testing coverage of eligible PLHIV on ART. For VL reagents that include instrument rental and consumables, PEPFAR Lesotho has budgeted US\$4,305,300, which is expected to cover 75% of the national need. The remaining cost is anticipated to be covered by GF. About US\$546,200 has been allocated to cover specimen transport services, consumables and ancillary equipment. In addition, \$215,000 has been allocated for laboratory personnel, training and technical assistance.

#### Early Infant Diagnosis (EID) Optimization

In the past two years Lesotho has made considerable progress in increasing access to virologic testing of HIV exposed infants, reducing turnaround time and improving the quality of services. In COP21, PEPFAR Lesotho will continue providing comprehensive support including, procurement and distribution of commodities (cartridges and consumables), specimen transport, testing services, care and support, and QA/QI activities. In addition to the national Reference Lab, 29 health facilities will continue providing EID services. Using a hub and spoke approach, 200 health facilities will access POC EID services.

In COP21, 95% and 5% EID testing will be provided using POC and conventional instruments, respectively. The implementation of POC EID will substantially improve coverage and all HIV exposed infants presented at MCH will be virologically tested. With DSD, PEPFAR will achieve virologic testing and linkage of care for 100 % of HIV exposed infants under 2 months. The overall turnaround time will be reduced to 1-2 days. Technical support including HR, supervision and M&E activities will continue as part of pediatric care and treatment services. The support also includes specimen transport, referral testing, result reporting, QA/QI and monitoring activities. PEPFAR Lesotho has allocated US\$466,540 for procurement and distribution of POC EID commodities, training and technical assistance. As part of the laboratory network optimization, the POC-EID platforms will be fully integrated to provide multiple testing services. POC instrument maintenance services will be included in the instrument/reagent rental agreements with the vendors.

PEPFAR Lesotho will continue to support MOH in all 10 districts to ensure that all HIV exposed infants are covered with prophylaxis and they keep up with the EID testing schedules while their parents are advised on the safest feeding options so as to protect them from getting infected during breast-feeding. Lactating mothers and their babies are kept as pairs MBP (Mother-baby-pair) in MNCH and they have the same clinic appointments. In cases where MBP missed the appointment, they will be reminded and tracked back to care to ensure that they are retained in care. Mother-baby-pair cohort analysis will be conducted annually and will evaluate the retention level within the PMTCT program. MBPs will graduate from MNCH to general ART when the baby is 24 months of age.

In Lesotho the EID schedule is aligned with the immunization schedule. Program data shows that the EID coverage within 2 months of birth is 81% with the transmission rate of 1.2% while the remaining proportion of HIV-exposed infants continue to present late for their first virologic test within 2 to 12 months. Because of that high coverage of EID, Lesotho will implement birth testing for high risk infants in COP21. PEPFAR Lesotho will continue to support MOH to improve EID and follow these infants through the continuum of care until their final PMTCT outcomes are known and prioritize rapid ART initiation to those who are infected. Lesotho MoH will review PMTCT program gaps that result in some infections and strengthen the program processes and procedures to eliminate MTCT. The country has a sufficient supply of LPV/r pellets for children under the age of 3 years.

#### Optimization of GeneXpert instruments for multi-testing purposes

Lesotho is using GeneXpert technology for diagnosis of presumptive TB cases. There are 63 GeneXpert (61 GX-IV and 2 GX-VIII) instruments that will provide optimized and integrated testing services. In COP20, GeneXpert utilization will be optimized and 95% of presumptive TB cases will be tested. As part of integration and optimization of services, the GeneXpert instruments will be used for multipurpose testing services. 75% of the GeneXpert capacity will be dedicated to TB testing while 25% will be dedicated

for POC EID and POC VL testing services. In addition, GeneXpert platforms are also used for rapid Xpert Xpress SARS-CoV-2 test, which is a rapid real-time RT-PCR test. The COVID-testing services will further be decentralized and will be further optimized using the available platforms.

As part of integrated laboratory support, PEPFAR will continue to procure TB lab commodities. In COP21, PEPFAR Lesotho budgeted US\$9,830,000 for TB /GeneXpert cartridge, other TB tests and consumables. About \$46,460 has been allocated for sample transport, training and technical assistance. GeneXpert instrument maintenance services will be included in instrument/reagent rental agreements with the vendor. The contract agreement is expected to be completed and implemented by mid FY22. Overall, PEFPAR's support is expected to cover 75% of the national testing demand while the remaining gap will be covered by GF.

# 5.0 Program Support Necessary to Achieve Sustained Epidemic Control

Key systems barriers identified through SID 2019, MER, and SIMS include: 1) weak supply chain management systems at all levels of the public health care supply chain system, 2) limited capacity in expansion of diagnostic and monitoring services and improvement in laboratory systems, 3) poor data quality to track 95-95-95 achievements for sustained epidemic control and 4) limited technical capacity and coordination of the HIV program. In COP19, the areas identified for above-site systems strengthening in order to achieve sustained epidemic control include:

- 1. Commodity security and supply chain
- 2. Laboratory services
- 3. Strategic information
- 4. HIV and TB program administration

Investments in these areas will address current programmatic gaps in health systems strengthening (HSS), which are crucial to achieving national 95-95-95 targets and epidemic control by the end of COP20. PEPFAR Lesotho will: 1) strengthen the supply chain management system in order to prevent stock-outs of HIV-related commodities, such as isoniazid for TPT and VL reagents and consumables, 2) strengthen laboratory systems to support all clinical services along the HIV treatment cascade, 3) strengthen strategic information to ensure timely, complete, and accurate data management to inform programmatic planning and 4) provide technical assistance to the Ministry of Health for key ART and TB program minimum requirements.

PEPFAR Lesotho is currently investing in all the areas that it can to sustain epidemic control. Once the systems for laboratory, supply chain, health information and HIV/TB programming are established and optimized, knowledge and skills transfer through our current implementing partners should enable the host country to assume operations. For full ownership, however, the host country will need to continually invest resources in the maintenance of these systems, including procurement of essential commodities.

# 5.1 Commodity Security and Supply Chain

# **Commodity Security and Supply Chain**

The State Office of the Investigator General's (OIG) August 2019 report classified supply chain management as the single most important barrier to the HIV response as Lesotho gets closer to epidemic control. OIG identified two general areas of concern regarding supply chain management:

- Internal Control Challenges: Embassy employees described a weak internal control
  environment within the Government of Lesotho as a general concern. Specific challenges
  included poorly written contracts that did not include performance indicators or delivery
  milestones and the lack of an inventory accountability process at the central and local level.
  Weak internal controls, in turn, could facilitate waste, fraud or mismanagement of USGovernment funded commodities.
- 2. Organization, Leadership, and Accountability: Embassy employees and a USAID funded study also cited ineffective coordination between the Lesotho Government organizations involved in commodity purchases. Late payments to vendors by the Lesotho Ministry of Finance and lengthy bureaucratic procurement processes were also identified as challenges.

OIG concluded that stockouts and low supplies of first-line ARV drugs and other commodities, even on a temporary basis, present risks to the PEPFAR program. Without a comprehensive understanding of the reasons for supply chain disruptions, the program risked not meeting the PEPFAR performance goals. Moreover, the program may not be able to ensure accountability for US Government funds provided for HIV/AIDS commodities procurement.

Between February 3 to 7, 2020, a joint mission between PEPFAR and the GF visited the Ministry of Finance (MOF), Ministry of Health (MOH) and Ministry of Public Service (MOP) with the objective of carrying out a root-cause-analysis (RCA) and developing a clear action plan to resolve the identified supply chain challenges.

Below is a summary of the resolutions of the OIG recommendations updates

- The Government of Lesotho (GOL) has established the Supply Chain Management Directorate (SCMD) and is in its phase of preparing for the right complement of staff.
- 2. The GHSC-PSM program has provided technical assistance for contract management practice within the SCMD and will continue to monitor inclusion of performance indicators or delivery milestones and accountability processes at the central and local level
- 3. The GOL to fulfill their pledge for funding 100% of the \$31.5 Million (LSL470 Million) ARV budget.

- 4. The budget line for all commodities to be ring-fenced to a new cost center under the SCMD. The current practice of combining medical commodities and all others in one account called "purchases" doesn't guarantee security and access to the funds.
- 5. Both PEPFAR and GF have committed to second seven staff for one year to the SCMD in the FY2021, with a clear transition plan for all seven staff to be absorbed into the new MoH staff establishment. The secondment of these staff to the SCMD is in addition to the 12 District Logistics Officers currently supported by both PEPFAR and GF.

In COP21, technical support and capacity building will continue to be provided to the MoH through the SCMD. DHMTs and the NDSO will ensure that there is a fully functional GOL-led HIV commodities and SCM system that can guarantee 100% security for all HIV-related commodities. PEPFAR Lesotho will only procure VMMC buffer commodities and PrEP buffer stock for all PEPFAR partners while the MoH procures TPT and ART commodities.

The COP21 supply chain management focus will be to ensure that standard operational procedures (SOPs) are developed and implemented to facilitate patient centered services. Furthermore, supply chain activities will support the scale-up and sustainability of differentiated service delivery models including MMS/D and CAGS and DDD commodity distribution. Supply Chain Management will support the DDD partner through capacity building in commodities management and reporting.

# The following are COP21 core activities:

1) Continue strengthening the collection, management and use of supply chain-related data for enhanced transparency and accountability of commodity ordering, distribution and final mile delivery. PEPFAR Lesotho has been successful in ensuring that all health facilities in Lesotho have a functional Informed PUSH system. The Informed PUSH allows sites to report through an automated requisition and reporting system within the DHIS II system. In the Informed Push, there is a new module that has been developed to collect and report consumption data at facility level to allow Lesotho to use consumption data for more accuracy during quantification. In COP21, the focus will be on monitoring that sites are effectively utilizing the data reporting platforms that include HIVST, 3-HP, TLD, DTG and TDF/3TC. In addition, the GHSC-PSM will also continue monitoring adherence to accurate reporting for 90 and 180 days MMD using the new daily tally sheets in dispensaries. These tally sheets have been distributed to all PEPAFR facilities and capacity building in using the tally sheets has been conducted. The GHSC will also continue to support mentorship programs for all sites having challenges accurately reporting through the new Consumption Tab Informed PUSH system. In the short to medium term, the Informed PUSH will serve as the key HIV commodity consumption information source for laboratory, ARVs, and TPT commodities. The GHSC-PSM will continue to work to ensure that the pharmacy and supply chain modules improve collection, management and analysis of HIV, laboratory, TB,

nutrition, family planning and other essential commodities within eRegister. The GHSC-PSM program will also work with the DHMTs to design and collect commodities data for decentralized drug distribution (DDD) pick-up points. The information from DDD pick-up points will need to be linked to the eRegister and DHIS2 reporting platforms.

- 2) Strategically segment the supply chain to better reach unique patient populations more efficiently via different tailored channels based on their needs (i.e. delivering medicines to more convenient locations and pickup points that strengthen adherence and retention). As Lesotho gets close to epidemic control, the biggest emerging challenge is retaining all stable and suppressed patients on treatment. A root-cause-analysis carried out by EGPAF revealed that most patients who are lost-to-follow-up (LTFU), dropout due to inflexible work (employment) commitments. In order to ensure that the second 95% is achieved and maintained, the GHSC-PSM will support the DDDs solution that will be piloted in COP20 for both urban and rural patients with commodity distribution and security. It will further support the MoH and DHMTs to develop SOPs to ensure uniform implementation of DDDs. The GHSC-PSM will support the implementation and capacity building of MOH, DHMTs, sites and pick-up point operators. It has conducted the first capacity building in Thaba-Tseka DHMT on commodities management and reporting strategies.
- 3) Make progress towards reducing long-term dependence on donor funding and refocusing technical assistance to support countries assuming increasing responsibility for oversight of the supply chain as the principal stewards for commodity availability and security. The Government of Lesotho has for the past 5 years, shown political will and leadership by funding 70% of the ARV budget. In FYs 2020-2021, the MoF has committed to fund 100% (\$11.5 million/M470 million)) towards ARVs and 100% of TB and TPT. Lesotho still relies on PEPFAR (75%) and GF (25%) for laboratory reagents and supplies. In COP21, a sustainable financing strategy will be formulated to assist the GOL to absorb the laboratory commodity costs. The GOL will be encouraged to consider vendor managed contracts, to negotiate better terms with suppliers (pooled procurement) and to benefit from better terms negotiated by global and regional pooled procurement platforms. It has begun its first Service Level Agreements (SLA) with VL and EID lab commodities through reagent lease agreement with the vendors (Roche and Hologic) using the global pricing. This significantly reduced the stock outs and machine breakdown thereby allowing us to increase our VL coverage. In COP21, the plan is to include Cepheid for GeneXpert and other integrated testing services.
- 4) Accelerate utilization of private sector capabilities and infrastructure, with near-term focus on warehousing and distribution, for operating the supply chain and for enhanced performance and increased visibility to the point of care. The GHSC-PSM has been working with the National Drug Services Organization (NDSO) for the last four years to improve transport management and efficient deliveries of HIV commodities to the last mile. In FY16, the GHSC-PSM supported the NDSO with transport network optimization technical

assistance (TA) whose main objective was to rationalize the transport fleet and find ways of delivering commodities within schedule. Although improvements have been observed, this is one space where the NDSO could benefit from Third Party Logistics (3PL) partners in COP20. This development would remove one burden from NDSO so they can concentrate on procurement and contract management. Through the GHSC-PSM support, the NDSO has implemented the Trans IT strategy to effectively monitor the commodities, vehicles and fuel used during distribution by mapping out the easier more accessible routes.

- 5) Proactively monitor and mitigate procurement and supply chain related risk in COP20. Taking into consideration both PEPFAR and the GF supply chain OIG reports; it becomes imperative that the GOL takes risk mitigation seriously. During the joint root-cause-analysis (RCA) visit, there were recommendations proposed to reform commodity management across the whole Lesotho supply chain pipeline. A couple of items that require emphasizing include:
  - 1. Timely payment for commodity orders: in FY 2018 2019, delays in payment went beyond March 31, 2019, resulting in a shortfall of \$9 million in the succeeding financial year (FY 2019 -2020). This situation led to a commodity gap at the end of FY 2019, which had to be covered by GF. The GHSC-PSM will support MOH to design a system for monitoring committed funds and ensuring that vendors are paid on time.
  - 2. Procurement and cash flow plans: the RCA revealed that the MOH struggles to complete and submit procurement and cash-flow plans to the Ministry of Finance and the GF. Since both the procurement and cash-flow plans are important and required documents by MOH, the GF and other donors, the GHSC-PSM will build the capacity of the SCMD to complete and submit these plans on time.
  - 3. The GHSC-PSM will support the MOH to put in place a supply chain quality assurance and improvement unit to ensure adherence to quality and performance standards within the supply chain management space.

# 5.2 Laboratory Service

The key system gaps in laboratory service were identified during site improvement through monitoring system (SIMS), a national assessment, and the sustainability index and dashboard (SID 2019) reports. There is still limited capacity in the expansion of diagnostic and monitoring services and improvement in laboratory systems. Challenges include, but are not limited to, lack of laboratory infrastructure, human resources, and lack of a national accreditation system to sustain quality of services. Based on the gaps identified, major activities with performance indicators and expected outcomes were described. In Table 6, laboratory network optimization, information system, continuous quality improvement, biosafety and waste management activities

that are directly aligned with overall sustainable epidemic control priorities are described.

Investment in above-site programs including laboratory is critical to address the current programmatic gap in service delivery and long-term sustainability. Strengthening laboratory systems will improve access to HIV/TB diagnostic and patient monitoring tests and quality of testing services, which will contribute to achieving 95-95-95 targets. The goal of the laboratory system strengthening is to ensure accurate, reliable and timely TB/HIV diagnostic and patient monitoring services are provided. The strategies include 1) optimizing sample referral and laboratory networks to improve testing coverage and turnaround time for viral load, early infant diagnosis, TB and OI diagnosis, 2) improving quality of laboratory services through continuous quality improvement and accreditation of services, and 3) strengthening the laboratory information and M&E system for timely analysis, reporting and decision making.

#### **Diagnostic Network Optimization**

In COP21, PEPFAR Lesotho will improve the national laboratory network, optimize and integrate instrument utilization for multiplex testing. This is expected to increase efficacy and effectiveness of laboratory services and improve testing coverage for diagnosis and patient monitoring services. The country has already completed mapping of instruments and implemented diagnostic network optimization. With the implementation of optimization and continued monitoring, the COP21 VL, EID, and TB testing targets will be achieved. The laboratory diagnostic network and the equipment available will also be used to integrate and scale up COVID-19 testing services and improve patient services.

# Continuous Quality Improvement (CQI) and Proficiency Testing (PT) program

Improving the quality of laboratory and point of care testing (POCT) services will ensure effective delivery of services. PEPFAR Lesotho will provide laboratory technical support to above site (2 reference) and site level (18 district, 13 minilabs and all POCT sites) laboratories that support HIV/TB care and treatment services. The support includes, but is not limited to, implementation of quality management systems, human resources, above site and site level training, site supervision, biosafety and waste management activities, equipment maintenance and an inventory management system.

Guidelines and standard operating procedures will be updated for specimen transport, testing, biosafety, waste management, along with preventive and routine maintenance of laboratory equipment. An inventory of standardized equipment platforms will be strengthened. Instrument/reagent rental agreements with manufacturers for major laboratory instruments supporting VL, EID, and TB diagnosis will be revised with inclusion of key performance indicators to monitor service providers. These activities

will reduce equipment down time and service interruption to less than 5 days. In addition, laboratory instruments will be optimized and used for multipurpose testing services to increase efficiency and cost effectiveness.

A quality management system with the 12 elements of a quality system will be used as a working framework. Clinical laboratories and POCT sites will be enrolled in proficiency testing (PT) schemes for VL, EID, CD4, TB and other tests including COVID-19. The laboratories POCT sites will be assessed, and improvement monitored using the WHO AFRO Stepwise Laboratory Quality Improvement Process towards Accreditation (SLIPTA) or the WHO/CDC Stepwise Process for Improving the Quality of HIV-Related Point-of-Care-Testing (SPI-POCT) checklist. The key areas to be reviewed include process control, corrective actions and documentation, safety and management reviews. By the end of COP21, two reference and three district laboratories will be accredited by the African Society for Laboratory Medicine (ASLM). In addition, 98% of clinical laboratories and POCT sites enrolled in the PT program will have successfully passed leading to improved performance and overall quality of testing services.

#### Laboratory information systems and M&E system

The electronic laboratory information system (LIS) will be upgraded to generate quality data and reduce the turnaround time of test result transmission for prompt management and monitoring of PLHIV on treatment. The laboratories will optimize the use of LIS to improve output, data flow between laboratories and health facilities and strengthen the VL/EID dashboard to support data analysis, visualization at national level, and quarterly reporting of patient and test level data. To improve patient care, the current LIS will be integrated with DHIS2 and eRegister.

# 5.3 Strategic Information

#### **DHIS<sub>2</sub> Optimization**

In order to ensure streamlined and efficient data flow, management, and use for programmatic decision-making, the open-source software platform for health programs, DHIS2, was implemented at the facility level in 2017. Challenges remain, however, regarding data quality. In COP19, PEPFAR focused on improving and institutionalizing DQA mechanisms and assessments to improve DHIS2. There is interoperability with the eRegister (currently being scaled up in Lesotho) and DHIS2, to minimize human error and streamline data entry into DHIS2 for reporting. All HTS, care and treatment data is auto reported into DHIS2 for sites that have been certified to transition to a hybrid paper/electronic stage. Data quality assessments are completed quarterly by PEPFAR for DHIS2 and DATIM. All partners play a role in assisting facilities with a discrepancy of greater than five percent between the two systems. The alignment of MOH and PEPFAR

systems will be a priority in COP21 so that data from DHIS2 can be imported into DATIM. PEPFAR will continue to support DHIS2 at the site, district, and central levels by providing training, equipment, and human resources, mentoring and strengthening data quality skills among staff.

#### **Electronic registers**

Lesotho has a large migrant population, both within and outside Lesotho. It is therefore difficult to accurately track patients along the clinical care cascade. High levels of linkage and retention are needed in order to reach national 95-95-95 targets. An electronic register and unique identifier system have been developed in Lesotho using OpenMRS and OpenEPMI. The system was set up in 45 facilities in four districts in Lesotho with the HTS, ANC and treatment modules operational by the end of COP18. The design and beginning of a pilot for a health information exchange (HIE) platform was also put in place by the end of COP18. The system is designed to ensure that all HIV clients have unique identifiers and is supported by the Ministry of Health Management Information System (HMIS) strategic plan and policy put in place in February 2019.

In COP19 and COP20, eRegisters were scaled up to an additional 133 facilities bringing the total to 178. This ensures that 90% of all people taking anti-retroviral medication will be registered in the eRegister system making case-tracking and surveillance possible. An automated DHIS2/eRegister link exists for ease of reporting in the system. In COP20 the pharmacy module was developed and implemented, and a lab dashboard will be operationalized in COP21. In COP20 the OpenHIE was scaled up in Lesotho. Use of a fingerprint biometric package is being considered for scale up in Lesotho. During COP20 no facilities moved from registering clients and achieving data quality (Stage 1) to reporting electronically and minimizing paper documents (Stage 2). The remaining 63 facilities will achieve Stage 2 during COP21. Technical support for the country wide system along with mentorship will continue throughout COP20 as the eRegister becomes widely used and depended on.

#### LePHIA 2020

PEPFAR Lesotho completed the second survey of the population HIV impact assessment (PHIA) in COP20. The survey began on December 5<sup>th</sup> and ended on March 26<sup>th</sup>, 2020 and included participants 15+ years of age. The LePHIA will characterize HIV incidence, national and sub-national HIV prevalence, VL suppression, and risk behaviors in a household-based, nationally representative sample of the population of Lesotho. The survey results, from both household and adult participant surveys and blood sample testing (HIV rapid testing, LAg avidity assay testing to detect incident infections, HIV VL and ARV metabolite testing along with genotyping and drug resistance testing on those determined to be recent infections) will give Lesotho an opportunity to calculate progress towards the UNAIDS 90-90-90 cascade since the first survey in 2016. In addition, information will be generated on the coverage and uptake of various HIV prevention, care and treatment

programs including PMTCT and whether people have accessed ARV treatment in South Africa. In COP20 we expect the first results to become available on World AIDS Day, 1 December 2020. Further analysis and report writing will take place through COP20 and will be finalized by September 2021.

#### 5.4 HIV and TB Program Administration

#### **Technical Assistance**

Even though good progress has been made to link HIV patients to care and treatment services, there remains a need to provide technical assistance to the MOH HIV and TB programs to build ownership, management, technical leadership, and implementation of national HIV/TB clinical programming. Technical assistance will be provided in COP20 to build capacity within MOH to collect, analyze, and use program data to improve HIV and TB programs. Support will be provided to the government to update national HIV and TB program guidelines, including guidelines to help track the transition to optimized ART regimens for adults and children (TLD transition), TPT scale-up, granular site management, and use of DBS for VL. Technical assistance will also be provided for the coordination of program implementation and program performance monitoring. These activities will enhance the government's ability to effectively implement national HIV/TB clinical programs and increase ART coverage for HIV and TB patients in Lesotho. ART coverage as of FY21 Q1 was 86%. For APR FY22 we must attain and sustain ART coverage of 90% for all districts, age groups and by sex.

Critical for the success of the ART program is the implementation of the Lesotho national quality assurance and quality improvement framework to ensure that explicit quality management practices including quality assurance and quality improvement activities are fully integrated into HIV and TB service delivery.

PEPFAR Lesotho will support the national HIV/TB technical working groups and district health management teams to ensure that CQI efforts are scaled up widely and routinely reviewed to support the monitoring framework.

PEPFAR Lesotho will support the MOH's HIV and TB program to address gaps in TB and HIV case finding as identified by the Lesotho first TB prevalence survey in 2019 and the recent LePHIA2020 results. In addition, PEPFAR will support MOH and DHMTs to address barriers along the TB and HIV cascade to improve HIV and TB service delivery. CQI activities will be reviewed with the MOH HIV and TB programs on a monthly basis to advance an integrated and effective CQI program and culture for the TB and HIV programs.

#### **Human Resources for Health (HRH)**

As Lesotho gets close to reaching epidemic control and attaining the 95x95x95 targets, the human resources for health (HRH) mix must evolve from scale-up to a focus on retention and managing patients lost-to-follow-up. PEPFAR programs in Lesotho have maintained a similar staff compliment from COP15 to date. These staffing patterns will be reviewed to consider alternative service delivery models now being implemented. In COP20, an analysis of HRH working in the PEPFAR response, evolving from finding and initiating patients on treatment to one that retains them, will be completed.

The analysis of HRH used the new data collection tools developed and recommended by OGAC and the HRH technical team. The HRH inventory completed in FY18 in Lesotho was a preliminary look at the workforce in the program. In COP20, the program has collected more detailed information. The inter-agency team, with support from headquarters, will provide overall guidance in this process and will hold monthly and field support visits to ensure that the HRH support is right-sized and a transition plan to the government of Lesotho and other partners will happen at the right time.

In COP21, PEPFAR will continue funding HRH activities that will ensure the readiness and preparedness of the MoH to take over some matured activities and HRH. PEPFAR has supported the MoH to develop an HRH Technical working group and a sustainability task team with multi-sectoral members from different Government Ministries to Private sector members. PEPFAR will continue to support the MoH through these bodies to pave a way for a smooth transition at the right time. The HRH TWG has reviewed the HRH development and strategic plan 2005-2015 to include elements of transition preparedness.

# 6.0 USG Operations and Staffing Plan to Achieve Stated Goals

The PEPFAR Lesotho team conducted a staffing analysis to assess the degree to which the current staffing footprint is aligned with the PEPFAR program. The following factors were key in the staffing analysis undertaken by PEPFAR Lesotho: partner management, the administration and management burden of the PEPFAR business practices (such as SIMS, POART, COP, and SID), and the space limitations of the Embassy.

As of March 2021, PEPFAR Lesotho will have eight vacant positions. For State, two vacancies are a result of recent resignations. These positions are: SIMS Coordinator and Small Grants Coordinator. The SIMS Coordinator position is close to advertisement. The Small Grants Coordinator position is an Eligible Family Member (EFM) position, and currently, there are limited candidates. For USAID, the six vacant positions are a result of recent resignations and some new positions that were previously approved in COP19. These positions are: Program Director, Deputy PEPFAR Coordinator, Biomedical Prevention Officer, Senior Strategic Information Advisor, TB/HIV Project Management Specialist, Care and Treatment Specialist, which were previously approved. The positions are at different stages of recruitment with most of them anticipated to be filled within FY2021. CDC will transition two senior technical US direct hire positions to locally employed staff (LES) by the end of 2021.

In COP20, for Peace Corps, the current M&E and Small Grants Coordinator will be split into two separate positions. The current staff member will remain in one of the two new positions and Peace Corps will recruit for a new Small Grants Coordinator to assist with the PEPFAR VAST grants and PCV reporting. The position description is completed and the position has been approved; however, due to the evacuation of all Peace Corps Volunteers worldwide in March 2020, hiring of the new position has been put on hold until there is a firm return date for Volunteers.

There are no large proposed changes from COP20 management and operation costs.

# APPENDIX A -- Prioritization

#### **B.2 Resource Projections**

Resource projections for COP21 budgeting were done using the COP21 Planning Level Letter, historic expenditures, and COP20 budgets as a baseline. COP21 budgeting used COP19 expenditure data to understand how mechanisms have historical spent money, compared to budgets. For budgeting new initiatives or program shifts, the PEPFAR Lesotho program also had discussions with implementing partners on projected costing data

# APPENDIX C- Minimum Program Requirements

Minimum Program Requirement	Status	COP19, COP20 and COP21 Implementation Plans
1. Adoption and implementation of Test and Start with demonstrable access across all age, sex, and risk groups, with direct and immediate (>95%) linkage of clients from testing to treatment across age, sex, and risk groups.	<ul> <li>A National Roll-out in 10 districts         completed in 205 PEPFAR-supported sites</li> <li>Roll-out in all sub-populations by age and gender</li> </ul>	Relevant policy updates to be made based on subsequent WHO or PEPFAR guideline revisions.
2. Rapid optimization of ART by offering TLD to all PLHIV weighing >30 kg (including adolescents and women of childbearing potential), transition to other DTG-based regimens for children weighing ≥20kg, and removal of all nevirapine-based regimens.	<ul> <li>National roll-out: 10 districts, 205 PEPFAR-supported sites completed with 95% of PLHIV currently on treatment on DTG-based regimens in FY21Q2</li> <li>Nevirapine-based regimen phasing out completed</li> </ul>	<ul> <li>Roll out of the pediatric DTG 10mg dispersible tablets</li> </ul>
3. Adoption and implementation of differentiated service delivery models, including six-month multimonth dispensing (MMD) and delivery models to improve identification and ARV coverage of men and adolescents.	<ul> <li>National roll out: 10 districts, 205 PEPFAR-supported sites</li> <li>MOH authorized saturation of 3-month MMD and limit 6-month refills to Basotho traveling to South Africa for extended periods of time</li> </ul>	<ul> <li>Advocacy to increase procurement of ARVs to meet demand for 6-month MMD</li> <li>Scale-up 6-month MMD for all stable patients</li> </ul>
4. All eligible PLHIV, including children, should complete TB preventive treatment (TPT) by end of COP20, and cotrimoxazole, where indicated, must be fully integrated into the HIV clinical care package at no cost to the patient.	<ul> <li>All PEPFAR supported sites.</li> <li>New TB guidelines recommend alternative TPT regimens (6H, 3HP, 3RH</li> <li>TPT surge continued in FY20/FY21.</li> <li>TPT MMD has been scaled-up for both adults and pediatric populations. since FY19Q3, 50,000 TPT initiations.</li> </ul>	<ul> <li>Transition to 3HP for individuals aged 12 and above.</li> <li>Considerations for RH for children less than 12.</li> <li>Implementation in all PEPFAR supported ART sites</li> </ul>

5. Completion of Diagnostic Network Optimization activities for VL/EID, TB, and other	<ul> <li>Patient chart review for historical TPT completion (estimated at to reach 85% by the end of FY21)</li> <li>National VL platform expanded in Mohale's Hoek to meet 90% current demand for VL tests</li> <li>POC/EID testing expanded to cover &gt;80% of</li> </ul>	<ul> <li>Continue to scale up TPT in DSD models for patients already on ART and no documented TPT completion.</li> <li>High throughput VL platforms added to meet demand for services</li> <li>Consolidate gains made in COP20 in VL</li> </ul>
coinfections, and ongoing monitoring to ensure reductions in morbidity and mortality across age, sex, and risk groups, including 100% access to EID and annual viral load testing and results delivered to caregiver within 4 weeks.	<ul> <li>DNA/PCR tests for HEI</li> <li>TB GeneXpert platform adequate to meet national demand</li> <li>POC/VL testing for PBFW, children, and those not virally suppressed roll-out planned in 12 sites.</li> <li>FY21Q1 results show 87% coverage of VL testing of patients current on ART</li> <li>Instrument mapping and laboratory network optimization plan completed</li> </ul>	<ul> <li>access, testing, and reporting</li> <li>100% VL coverage to all patient eligible for VL</li> <li>Laboratory network optimization implemented and integrated POC testing services provided in 29 laboratories</li> <li>Online referral and result reporting implemented and VL test turnaround time reduced to &lt; 14 days</li> <li>95% POC EID coverage with turnaround time 1-2 days</li> </ul>
6. Scale up of index testing and self-testing, ensuring consent procedures and confidentiality are protected and assessment of intimate partner violence (IPV) is established. All children under age 19 with an HIV positive biological parent must be tested for HIV.	<ul> <li>Index Testing:         <ul> <li>National Roll-out: 10 districts, &gt;200</li> <li>PEPFAR-supported sites at facility and community</li> <li>Roll-out in all sub-populations by age and gender</li> </ul> </li> <li>HIV Self-testing:         <ul> <li>National Roll-out: 10 districts, &gt;200</li> <li>PEPFAR-supported sites at facility and community</li> <li>Prioritized sub-populations are men, AGYW, partners of index clients, KP, and partners of PMTCT women</li> </ul> </li> </ul>	<ul> <li>Index Testing:         <ul> <li>Roll out to all PEPFAR supported sites (&gt;200) community and facility</li> <li>Monitor coverage and fidelity of implementation</li> <li>&gt;60% of HTS_TST_POS from index testing</li> </ul> </li> <li>Roll-out of the National tools to integrate IPV screening and monitoring in index texting services, including consent, and reporting of adverse events</li> <li>HIV Self-testing:         <ul> <li>National roll out in al 10 districts, facility &amp; community</li> </ul> </li> </ul>

	Direct and immediate assessment for and offer of prevention services, including pre-exposure prophylaxis (PrEP), to HIV-negative clients found through testing in populations at elevated risk of HIV acquisition (PBFW and AGYW in high HIV-burden areas, high-risk HIV-negative partners of index cases, key populations and adult men engaged in high-risk sex practices)	•	National roll out: 10 districts at facility and community levels PrEP is currently being offered to all HIV-negative clients at elevated risk of HIV acquisition Revision of the National PrEP Implementation plan	•	<ul> <li>Prioritized sub-populations are men, AGYW, partners of index clients, KP, and partners of PMTCT women</li> <li>Strengthen monitoring and reporting</li> </ul> Consolidate gains in PrEP roll-out to all eligible clients and strengthen retention
8.	Alignment of OVC packages of services and enrollment to provide comprehensive prevention and treatment services to OVC ages 0-17, with particular focus on 1) actively facilitating testing for all children at risk of HIV infection, 2) providing support and case management for vulnerable children and adolescents living with HIV 3) reducing risk for adolescent girls in high HIV-burden areas and for 9-14 year-old girls and boys in regard to primary prevention of sexual violence and HIV.		Reducing risk for adolescent girls in high HIV-burden areas and for 9-14-year-old girls and boys with regards to primary prevention of sexual violence and HIV.  Providing support and case management for vulnerable children and adolescents living with HIV. Offering enrollment to 90% CLHIV < 15 and for OVC comprehensive services.  All three services are currently included in the OVC package, for both COP19 and 20. The OVC partner is now present in all 10 districts and is in the process of reducing risks for adolescent girls by expanding services that emphasize primary prevention of sexual violence and HIV into the 5 highlands districts. Actively facilitating testing for all children at risk of HIV infection.	•	Consolidation of the comprehensive prevention and treatment service package for OVC ages 0-17 years and their household members Support for OVC eligible for graduation
9.	Elimination of all formal and informal user fees in the public sector for access to all direct HIV services	•	National Roll-out: 10 districts, 179 PEPFAR-supported sites		

and medications, and related services, such as ANC, TB, cervical cancer, PrEP and routine clinical services, affecting access to HIV testing and treatment and prevention.  10. OUs assure program and site standards are met by integrating effective quality assurance and Continuous Quality Improvement (CQI) practices into site and program management. CQI is supported by IP work plans, Agency agreements, and national policy.	<ul> <li>Roll-out in all sub-populations by age and gender</li> <li>CQI implemented in all 10 districts</li> <li>Functional site level QI teams in over 85% sites</li> <li>Over 200 CQI on-going projects based on clinical cascade data         <ul> <li>.</li> </ul> </li> </ul>	Continue integration of QI/QA in all treatment sites
11. Evidence of treatment and viral load literacy activities supported by Ministries of Health, National AIDS Councils and other host country leadership offices with the general population and health care providers regarding U = U and other updated HIV messaging to reduce stigma and encourage HIV treatment and prevention.	PEPFAR's treatment partners have been disseminating U=U messaging at the health facility level.	Treatment literacy and U=U messaging integrated in the MOH National ART Consolidated Guidelines
12. Clear evidence of agency progress toward local, indigenous partner prime funding.	<ul> <li>USAID: 3 local/regional recently awarded</li> <li>CDC: Treatment and laboratory cooperative agreements moved into recompete status, with a new award date of October 1, 2020 for both. In both instances, local applicants are being given preference points. The Notice of Funding Opportunity</li> </ul>	<ul> <li>USAID: 1 Transition award for one of the local sub-partners to become a prime partner</li> <li>On-going capacity building of local IPs and their sub-partners</li> <li>CDC: Activity mobilization of the new treatment and laboratory awards</li> </ul>

	announcements were published on January 9, 2020.	
13. Evidence of host government assuming greater responsibility of the HIV response including demonstrable evidence of year after year increased resources expended.	• In recent years, as PEPFAR's budget for Lesotho has increased, the total funding towards the HIV response by the GOL has remained level. Funding from the host government decreased from 40% of the overall HIV budget in 2015 to 30% in 2019 due to increased PEPFAR investments.	Share of the government's functional and financial responsibilities will be monitored through the biennial completion of the responsibility matrix
14. Monitoring and reporting of morbidity and mortality outcomes including infectious and non-infectious morbidity.	<ul> <li>Since their introduction PEPFAR Lesotho has been reporting the following MER indicators: TX_ML for HIV treatment outcomes; CXCA_SCRN and CXCA_TX for the secondary prevention of cervical cancer; and TB_PREV for the treatment of latent TB infections among people living with HIV/AIDS.</li> <li>The cervical cancer program has been scaled up to all high- and medium- volume sites, including 4 regional LEEP treatment centers.</li> <li>Advanced HIV Disease Management has been rolled out in 17 PEPFAR supported hospitals.</li> </ul>	• Increase coverage of cervical cancer program, scale-up the AHD program to high volume sites, and ongoing strengthening of the TB program.

UNCLASSIFIED 85

15. Scale-up of case-based surveillance and unique identifiers for patients across all sites.	<ul> <li>Phased roll-out of Recency testing to all 10 districts.</li> <li>eRegisters rollout in 178 facilities completed. The Health Information         Exchange is functioning and sharing data between 175 facilities.     </li> </ul>	<ul> <li>Scale-up of Recency testing</li> <li>Institutionalization of the eRegister system with 90% of facilities using the system as a point-of-care with no summary forms. All reporting comes from eRegister to DHIS2.</li> <li>Scale up pharmacy module and lab interoperability.</li> </ul>
---	---	--

## APPENDIX D- American Rescue Plan Act

PEPFAR will be receiving an additional \$3,760,000 in COP20 and COP21 through the American Rescue Plan Act for PEPFAR programs. These funds will be used to support: 1) vaccine delivery for our beneficiaries and COVID-19 surveillance and 2) program recovery from the impact of COVID with regards to index testing, cervical cancer, VMMC, PrEP, and key populations.

#### I. Vaccine Delivery

Lesotho's National Deployment and Vaccination Plan calls for the immunization of all adults with priority given to those adults with underlying conditions. In the first phase of the vaccination campaign for health care workers, challenges identified included poor data collection and poor logistics coordination. An incredible amount of organization and coordination are needed for vaccine delivery and PEPFAR care and treatment partners are well-positioned to efficiently and effectively deliver vaccines to PLHIV. This service can easily be integrated into the normal care and treatment of PLHIV. In addition, PEPFAR partners are well-positioned to bring clients back into care for ART as PLHIV come for vaccines. The program will utilize existing PEPFAR-supported staff (i.e. nurses, records assistants, focal persons, and lay counsellors) at >200 health facilities and community sites to provide vaccine delivery at a level of effort appropriate for the vaccine schedule being implemented.

#### II. CellPHIA

COVID19 surveillance efforts in Lesotho have been poorly implemented since the start of the pandemic. The lack of reliable information on pandemic activity has hampered national response efforts. The PEPFAR partner that conducted the 2020 LePHIA will continue to do a weekly phone survey of participants to assess COVID19-like symptoms to monitor pandemic activity at the community level nationwide.

#### III. Index Testing Surge

The COVID-19 pandemic has affected uptake of index testing mainly due to restrictions on travel, shortage of human resources for health due to mandated quarantines, rotations, or isolation, and policy restrictions that halted community based services during FY20. PEPFAR Lesotho will implement an index testing surge campaign as a measure to accelerate uptake and coverage in 10 districts, including MNCH settings. The index testing surge goal is to increase the proportion of positives generated from this model and improve testing coverage among sexual partners and biological children of adult index clients currently active on ART. The program will prioritize index clients who are viremic, newly diagnosed, new on ART, TB/HIV co-infected, pregnant and breastfeeding women and siblings of children aged <19 years on ART. All identified new positives will be linked to treatment and high-risk individuals will be linked to PrEP services. The index surge will be implemented in the high and medium-volume sites through recruitment of additional HRH.

#### IV. Cervical Cancer Surge

PEPFAR cervical cancer program implementing partners will develop a surge plan for all 10 districts. EGPAF/PUSH will hire 25 temporary nurses to work as roving teams to provide cervical cancer screening services at supported sites, including MNCH settings. These nurses will be trained by the existing EGPAF national technical team of trainers on latest cervical cancer screening guidelines and be deployed to provide additional services at high volume sites using a predefined schedule.

### V. VMMC/PrEP

PEPFAR Lesotho plans to intensify demand generation and service delivery for VMMC and PrEP. Proposed activities include:

- Recruit and train a minimum of two Community Health Promoter (CHP) per site (VMMC and PrEP) to conduct demand generation in their respective catchment areas where services have been scheduled.
- Identify, recruit and train additional volunteer community advocates (VCAs) for at least 20 per site (for VMMC and PrEP). VCAs are usually recruited as expert PrEP clients, satisfied VMMC clients, or other community influencers who are skilled at linking potential clients to services.
- Resume group-based demand creation activities in line with government restrictions. These will include road shows in particular at village level where crowd control can be practiced in collaboration with the local authorities.
- Increase number of VMMC and PrEP mobile teams. Health Center outreach will be conducted for 1-week at a time using a booking system to avoid overcrowding.
- Increase funding to CHAL for expansion of grants under contracts to CHAL facilities which have been trained to conduct VMMC but lack sufficient funding to allocate providers, secure commodities, and support M&E.

#### VI. DREAMS

PEPFAR Lesotho plans to accelerate DREAMS activities through the following activities:

- Scale up retention and reach of AGYW through virtual safe spaces by procurement of 400 tablets to accommodate all AGYW participation in the DREAMS services
- Improve completion of the primary package of services by 152 DREAMS Youth Mentors (4 per community council) and 21 Peer Mentors in higher institutions of learning, PrEP Nurses, PrEP Counsellors and PrEP stars
- Scale up socioeconomic strengthening activities to increase number of AGYW who access job opportunities and entrepreneurship services
- Scale up community DREAMS services and reach more AGYW with more services in all supported SNUs and community councils by hiring extra vehicles

#### VII. Key Populations Programs

PEPFAR Lesotho will implement the following activities to accelerate key populations programming:

- Engage additional peer educators, professional counsellors, and nurses to scale up EPOA, psychosocial support services, and PrEP.
- Rent additional vehicles to ensure that KPs are easily reached through community ART distribution, outreaches, and tracking of LTFU.

Support the MOET to promote remote learning, expand coverage of remedial classes for students enrolled in LBSE, and train Grade 11 teachers to expand LBSE coverage in the DREAMS districts.
