HIV

POST (EXPOSURE (PROPHYLAXIS (PEP)

TRAINING SLIDES

To capacitate health care providers to effectively deliver HIV post-exposure prophylaxis (PEP) as an emergency HIV prevention intervention.

ASSESSING ELIGIBILITY FOR PEP

B

2

4

PEP INITIATION AND CLINICAL MANAGEMENT

PEP SUPPORT AND COUNSELLING

Post-Exposure Prophylaxis or PEP, is a medication given within 72 hours to a person who may have been exposed to HIV to prevent them from getting infected with HIV.

WHAT IS THE DIFFERENCE BETWEEN PEP, PREP & ART?

PEP, PrEP and ART are different kinds of ARV medications that are given at different times for the management of exposure to HIV.

Prevent HIV

72 Hours

PEP Post-Exposure Prophylaxis

ARV medication taken by HIVnegative persons

After

exposure to HIV within 72 hours for 28 days

taken by HIVnegative persons

Before

HIV exposure to prevent HIV infection taken by *people*

Living with HIV

to reduce viral load and increase CD4 count

RATIONALE FOR PEP

PEP is an emergency intervention for ALL persons

PEP is part of HIV

prevention

72 Hours

- PEP is a combination of HIV drugs that can stop the virus taking hold. ullet
- The preferred PEP regimen healthy adults and adolescents is:
 - Tenofovir disoproxil fumarate (TDF) 300 mg +
 - Lamivudine (3TC) 300 mg + ullet
 - Dolutegravir (DTG) 50 mg once daily.
- The drugs are given as once-a-day TLD tablet (TDF, 3TC and DTG)

How PEP works

is a combination of 3 **ARV**s:

- 1 Tenofovir (NRTI)
- 2 Lamivudine (NRTI)
- 3 Dolutegravir (INSTI)

When HIV enters a healthy T-cell, it attempts to make copies of itself, using an enzyme called reverse transcriptase.

The **NRTIs** block this enzyme – preventing HIV from making copies of itself. Once HIV has made copies of itself, it uses another enzyme called **integrase** to join the new virus DNA with the human cell's DNA.

3

The **INSTIs** blocks the integrase to prevent the new virus from joining with the human cell DNA, which also prevents the virus from making copies of itself.

By getting high levels of oral PrEP in the **blood stream**, **rectum** and **vaginal tissues**, you can prevent HIV from entering / replicating in the T-cells.

How PEP works

www.myprep.co.za

Stages of the HIV lifecycle: HIV attaches to the surface of the 1. CD4 cell.

- 2. HIV proteins and enzymes are released into the cell.
- Reverse transcription produces a 3. double strand HIV.
- Integrase enables HIV to link into 4. the cell's DNA.
- Protease cuts and reassembles 5. new HIV.
- Each cell produces hundreds of 6. new virions.

@MyPrEP_SA

PEP starts to work almost immediately after being taken and works on multiple sites where HIV can make copies of itself.

The cells originally infected in the body would then die naturally within a short period of time without producing more copies of HIV.

If a person takes PEP very early after being exposed to HIV, they stand a very good chance of stopping the virus from establishing itself in the body

WHO SHOULD TAKE PEP?

*PEP IS RECOMMENDED IF:

The individual was exposed blood, semen or vaginal, secretions, breastmilk or other infectious bodily fluids of an **HIV** positive individual/unknown HIV status

*High risk exposure may occur through broken skin (e.g. cuts, needlestick injuries) or via mucous membranes (e.g. mouth, vagina, eyes)

PEP is NOT RECOMMENDED:

If an individual was exposed to the bodily fluids of an **HIV negative** individual, where acute antiretroviral syndrome has been ruled out.

GUIDE TO OFFERING PEP

HIV Post Exposure Prophylaxis

PEP is an emergency treatment

A person seeking PEP or exposed to HIV should be attended to immediately.

PEP must be offered to all persons that have been potentially exposed to HIV.

Make sure that you take the time to listen to the clients concerns and address these during your counselling.

When an individual reports exposure to HIV:

1. Confirm that exposure to HIV occurred within the past 72 hours

2. Explain to the client:

- PEP is ARV medication given to an HIV-negative person after exposure to HIV to prevent them from being infected with HIV.
- PEP should only be taken by HIV-negative individuals.
- It is most effective if taken as soon as possible after the exposure to HIV.
- Confirm that the client is agreeable to take the stat dose.

3. Administer the first PEP dose immediately

4. Conduct HIV (rapid) test

- Provide pre-test counselling:
- Administer the HIV test
- Provide the test result and post-test counselling
- If test result is HIV-positive refer for or initiate ART.
- If test result is HIV-negative.

PEP Drug Regimen				
Adults and children ≥10 years	*Children (<10 years)			
If weight is ≥35kg: TDF 300mg + 3TC 300mg + DTG 50mg, once daily as TLD	If weight is <20kg: AZT/3TC twice daily + LPV/r twice daily			
(add additional DTG 50mg, 12 hourly if on TB treatment or any other enzyme-inducing treatment)	If weight is ≥20kg: AZT/ 3TC twice daily + DTG 50mg, once daily			

MOVE TO POINT 5 ON THE BACK OF THIS GUIDE TO CONFIRM THE EXPOSURE:

5. Confirm the exposure

In the last 72 hours did you:

unknown?

The type of exposure, HIV status of source persons and the material the person was exposed to, will determine the level of risk. Refer to the table below to assess the level of risk.

	LOW RISK (PEP MAY NOT BE REQUIRED)	HIGH RISK (PEP RECOMMENDED)
Type of exposure	Intact skin Human bites - no blood	Mucus membrane/non-intact skinPercutaneous injury
Source	HIV-negative	HIV-positive/status unknown; clinically well/unwell
Material	Saliva, tears, sweat, faeces, urine, sputum, vomit	 Semen, vaginal secretions, synovial, pleural, pericardial, peritoneal, amniotic fluids Blood and bloody bodily fluids; CSF, viral cultures in labs Breastmilk from an HIV-positive woman

6. Explain to the client what PEP is, the benefits of taking it, and how it needs to be taken

- they remember.
- headaches.

7. Provide the client with a prescription for collection of 28 days of PEP

Provide information about other tests and treatments that will be conducted:

Follow-up

- Inform that the require HIV tes 12 wee
- Explain client t for con repeat to mak they ar HIV-pos

8. Provide the date for the next visit

Use following questions to confirm the type of expose to assess their level of risk and eligibility to continue PEP.

a. have unprotected sex (sex with no condom or burst condom) with someone who is HIV-positive/whose HIV status is

b. have any contact with blood, semen, vaginal fluids (or other contaminated material)?

c. share needles when you injected drugs?

In the last 72 hours, did the child ingest breast milk from another mother who is HIV-positive/HIV status is unknown?

If the client responds 'yes' to any of these questions, inform them that they may have been exposed to HIV and may benefit from PEP.

PEP is ARV treatment given to HIV-negative individuals after possible exposure to HIV, to prevent HIV infection.

PEP medication is taken daily for the full 28 days.

PEP works best if it is taken at the same time every day. If a dose is missed, the client must take it as soon as

PEP is safe, but some people may experience side effects, the most common being nausea, diarrhoea, and

- If there are side effects, the client should not stop taking PEP but should come back to the clinic.
- PEP can be taken during pregnancy and breastfeeding.

GUIDE TO

OFFERING PEP

- PEP is safe for pregnant women and will not hurt the unborn baby.
- Emphasize ongoing regular use of condoms while the client is on PEP.

After providing the above information check with the client that they want to continue taking PEP?

p for PEP	Other assessments
the client ey will	If a client was exposed to HIV through sexual contact the client may also require screening and testing for: Description:
t at 4 and	 Clients with abrasions, cuts, or bites should be asked about their tetanus immunisation status
KS.	and offer immunisation if appropriate.
he reason ducting a	 Ask the client about current contraceptive use and oner emergency contraception in needed. Identify any other issues (especially mental health, substance abuse, sexual assault) that may face the client and provide the necessary, support, guidance and referral.
HIV test is e sure that e not	 Conduct risk-reduction counselling and discuss with the client future HIV prevention options: Condom use PrEP
sitive.	Screen for TB and COVID.

- Confirm exposure was within 72 hours.
- Assess the date and time of exposure.
- If exposure occurred within 72 hours, explain to client what PEP is and why they should be taken immediately **AND PROVIDE PEP STAT dose**.
- If exposure occurred more than 72 hours, offer HTS and manage appropriately.

Exposure to HIV is a medical emergency

- Provide pre- and post- HIV test counselling
- Conduct a Rapid HIV test
- If HIV negative, confirm type of exposure to determine need for PEP.
- If HIV test is reactive, initiate on ART (or refer)

HIV TEST : SOURCE PERSON

JOB AID

Clinical Algorithm

for Initiation of HIV Post Exposure Prophylaxis (PEP) for HIV prevention

ASSESSING NEED FOR

Confirm the exposure by asking the client the following:

- 1. Did you have unprotected sex (sex with no condom or a burst condom) with someone who is HIV positive or whose HIV status is unknown to you?
- 2. Did you have any contact with blood, semen or any vaginal fluids (or other contaminated material)?
- 3. Do you share needles when injecting drugs?

If the client responds "yes" to any of these questions, inform them that they may:

1. Have been exposed to HIV and are at risk of being infected with HIV, and 2. They may benefit from PEP

Remember, if a client is already on PrEP and is adherent, then PEP is not required.

ASSESSING NEED FOR PEP

For persons weighing ≥35kg :

Once-a-day **TLD** tablet

Tenofovir 300mg plus

Lamivudine 300mg plus

Dolutegravir 50 mg

PEP Drug Regimen Adults and children ≥10 years If weight is ≥35kg:

- TDF 300mg +
- 3TC 300mg +
- DTG 50mg,
- once daily as TLD

- PEP should be taken at the same time every day
- If dose is missed, it can be taken as soon as it is remembered
- PEP is safe during pregnancy and breastfeeding
- Use condoms while on PEP
- PEP is safe
- Common side effects: nausea, diarrhoea, and headaches
- Return to clinic if worried about side effects

HIV Post Exposure SHEET Prophylaxis (PEP)

What is PEP?

Post Exposure Prophylaxis or PEP is an emergency treatment that is given to a person exposed to HIV to prevent HIV.

- The sooner PEP is started after a possible exposure, the more effective it is.
- PEP is using ARV medication to prevent HIV.
- PEP must be started within 72 hours of possible exposure to HIV.
- PEP can only be taken by HIV-negative individuals.
- PEP is taken for 28 days after possible exposure to HIV to prevent an HIV infection.

Who should take PEP?

- Anyone who may have been exposed to HIV through contact with blood, body fluids, during sex or through their work.
- It's only recommended for people who are HIV negative or don't know their status.

Is PEP safe?

It is safe to take PEP to prevent you from getting HIV.

PEP can be taken when pregnant and breastfeeding, and will not hurt you or your baby.

How are ARVs used differently for HIV prevention and treatment?

ARVs can be used to prevent HIV:

- PrEP: When ARVs are taken before someone is exposed to HIV to protect them from HIV it is called Pre-Exposure Prophylaxis (PrEP).
- **PEP:** When ARVs are taken within 72 hours after exposure to HIV to prevent HIV it is called PEP.
- ARVs can be used as treatment:
- ART: ARV are used to treat HIV-positive people to reduce the levels of HIV in the body, this is called ART.

1. 2. 3. 4. 5. 6. 7.

Getting started on PEP:

- 1. Visit your clinic as soon as possible if you had unprotected sex or came into contact or other body fluids.
- 2. Tell the clinic staff that you need to be seen to immediately.
- 3. PEP can only be given to you if you were exposed to HIV in the past 72 hours.
- 4. If you report within 72 hours you will be given your first dose of PEP.
- 5. You will be tested for HIV to check that you are HIV negative.
- 6. If you test HIV negative the nurse will check if you require PEP.
- 7. The nurse will give you a prescription for PEP for 28 days.

If you test positive, the nurse will start you on treatment.

FACT

SHEET

How to take PEP:

- PEP must be taken for 28 days.
- Try to take PEP at the same time every day.
- If you miss a dose, take the next dose as soon as you remember.
- Do not take a double dose.
- Continue to use of condoms while you are on PEP.
- Some people that take PEP may feel nauseous or have diarrhoea or headaches.
- If you do experience any of these do not stop taking PEP, visit the clinic for further help.

When do you need to come back to the clinic?

- You will return after 4 weeks and again in 12 weeks for an HIV test or any other tests that may be needed.
- The clinic will give an appointment for when you need to return.
- These tests are important to make sure that the PEP has worked and that you have not become HIV-positive.
- If you require help or more information, visit your clinic.

Protect yourself from HIV

If you are worried that you may be exposed to HIV again talk to the nurse about taking PrEP and using condoms.

Explain what is PEP?

Post Exposure Prophylaxis or PEP is an emergency treatment that is given to a person exposed to HIV to prevent HIV.

- PEP is using ARV medication to prevent HIV.
- PEP must be started within 72 hours of exposure to HIV.
- PEP can only be taken by HIV-negative individuals.
- PEP is taken for 28 days after exposure to HIV to prevent an HIV infection.

Who should take PEP?

- Anyone who may have been exposed to HIV during sex or through their work.
- It's only recommended for people who are HIV negative or don't know their status.

Is PEP safe?

- It is safe to take PEP to prevent you from getting HIV.
- PEP can be taken when pregnant and breast-feeding and will not hurt you or your baby.

How are ARVs used differently for HIV prevention and treatment?

ARVs used to prevent HIV

PrEP

When ARVs are taken before someone is exposed to HIV to protect them from HIV it is called Pre-Exposure Prophylaxis (PrEP)

PEP

When ARVs are taken within 72 hours after exposure to HIV to prevent HIV it is called PEP.

ARVs used for treatment

ARV are used to treat HIV-positive people to reduce the levels of HIV in the body, this is called ART.

How to take PEP?

- PEP must be taken for 28 days.
- Try to take PEP at the same time every day.
- If you miss a dose, take the next dose as soon as you remember.
- Do not take a double dose.
- Continue to use of condoms while you are on PEP.
- Some people that take PEP may feel nauseous or have diarrhoea or headaches. If you do experience any of these do not stop taking PEP, visit the clinic for furtner heip.

When do you need to come back to the clinic?

- You will return after 4 weeks and again in 12 weeks for an HIV test or any other tests that may be needed.
- The clinic will give an appointment for when you need to return.
- These tests are important to make sure that the PEP has worked and that you have not become HIV-positive.
- If you require help or more information, visit your clinic.

Protect yourself from HIV

If you are worried that you may be exposed to HIV again let's discuss what your options are - taking PrEP and using condoms.

ART MEDICATION SIDE EFFECTS

Drug	Acronym	Side Effect
Tenofovir	TDF	 Well tolerated Headache, Nephrotox with pre-existing rena
Lamivudine	3TC	 Well tolerated
Dolutegravir	DTG	 Well tolerated Headache, GIT upset Occasional insomnia

xicity (avoid in individuals al disease)

(to be taken at night)

DOLUTEGRAVIR **IN PREGNANT**

Dolutegravir can be safely given to pregnant

EVIDENCE OF BENEFIT:

- DTG supress HIV more rapidly when compared to EFV.
- DTG has higher barrier to resistance when compared to EFV.

*NDoH Circular: Dolutegravir in pregnancy, Reference: 2021/06/29/EDP/01

EVIDENCE OF HARM:

There is no difference in the risk of neural tube defects in women who were given DTG at conception when compared to EFV.

In one RCT, the average weight gain during pregnancy was similar amongst women taking DTG/TDF/FTC or EFV/TDF/FTC regimens.

- Provide 28 day supply of PEP or prescription for client to collect at the pharmacy.
- Provide follow-up appointment date (i.e. 4 weeks from the day PEP is initiated)

FOLLOW-UP ARRANGEMENTS

Contact client within 48 hours to assess medication tolerance Assist with managing side effects.

4 weeks after	
PEPinitiation	
HIV	- 11
test	- 11

12 weeks after **PEP** initiation

> HIV test

FOLLOW-UP: 4 WEEKS

For all clients testing HIV negative at 4 weeks:

- Provide risk reduction counselling
- Educate on available HIV prevention methods
- Determine if continued exposures to HIV is likely
 - If YES, client could be a candidate for PrEP
 - If interested, initiate the client on PrEP and manage as per PrEP guidelines
- If not initiated on PrEP, provide the follow-up appointment date (12 weeks from the day PEP was issued).

Clients testing HIV: initiate ART or refer.

Tests for exposed person

Tests	Baselin e	4 weeks	12 weeks
HIV rapid test	Х	Х	Х
Other tests if avai guidelines.	lable or re	quired as	per

HBV		*HBsAb -1 to 2 months after ful vaccination
HCV	HCV PCR	
Renal function	Repeat if baseline results were abnormal or if adverse effects are reported.	
FBC	Repeat if baseline results were abnormal or if adverse effects are reported.	
Syphilis		RPR or TB antibody
Pregnancy test	Repeat if menstrual period did not of within 4 weeks of sexual exposure.	occur

* The HBV vaccination schedule is usually month 0, month 1 and 4-6 months later. HBsAb to be tested only after all three vaccination doses administered.

TRANSITIONING FROM PEP TO PREP

FOR CLIENTS WHO ARE LIKELY TO HAVE CONTINUED EXPOSURE TO HIV AND ARE INTERESTED IN PREP:

- Initiate PrEP on the same day of the 4week or 12-week follow-up visit.
- PrEP initiation should follow National PrEP guidelines.
- Client **PrEP** follow-up appointment at 1month post-PrEP initiation.
- Manage client as per National PrEP guidelines.

PEP PACKAGE OF SERVICES

PEPImmediate Services

• PEP STAT dose

- HIV counselling and testing
- PEP complete dose
- Emergency contraception
- Psychosocial support
- Counselling

Additional Considerations

Screening and management for:

- STIs and Pregnancy
- Tetanus
- Hepatitis B and C

ALTERNATIVE REGIMENS

Alternative PEP drug regimens should be considered if:

- Client has compromised kidney function
- Client has comorbidities (on TB drugs or on carbamazepine)
- Source person is HIV positive and is on ART
- Absolute contraindications to TLD

ALTERNATIVE REGIMENS

Special considerations	Alternative regin
TB drugs/Carbamazepine	Additional 50mg dose of DTG given the second
DTG contraindicated/ not tolerated	TDF (300mg) + FTC (200mg) + AT TDF (300mg) + FTC (200mg)+ LP
Compromised kidney function	eGFR 10-50mls/min: AZT 300m eGFR <10mls/min: AZT 300mg o
Source person failing second line based regimen)	ART (TDF AZT/3TC (300/150mg) bd + DTG
Source person failing AZT-based A regimen	ART TDF (300mg) + 3TC (200mg) + D ⁻
Source patient failing LPV/r-based ART regimen	Consult with virologist/infectiou

*Consult specialist about stopping TDF on completion of PEP with HBsAg positive clients (i.e., client with confirmed hepatitis)

men

ven 12 hours after the initial dose

FV/r (300/100mg) as daily dose or

PV/r (200/50mg) two tablets twice daily

ng bd + 3TC 150mg daily + DTG 50mg daily daily + 3TC 50mg daily + DTG 50mg daily

50mg daily

TG 50mg daily (TLD)

us disease specialist

Drug interactions with dolutegravir

Interacting Drug	Effect of Coadministration	Recommendation
Rifampicin	Dolutegravir	Double DTG dose to 50 mg 12-hourly. If on TLD FDC, add DTG 50 mg 12 hours after TLD dose
Polyvalent cations (Mg ^{2*} , Fe ^{2*} , Ca ^{2*} , Al ^{3*} , Zn ^{2*}) e.g. antacids, sucralfate, multivitamin and nutritional supplements	Dolutegravir	Calcium supplements decrease DTG concentrations if taken together on an empty stomach. To prevent this, DTG and calcium supplements can be taken at the same time if taken with food. Iron supplements decrease DTG concentrations if taken together on an empty stomach. To prevent this, DTG and iron supplements can be taken at the same time if taken with food. However, calcium and iron supplements must be taken at least 4 hours apart. Magnesium/aluminium containing antacids decrease DTG concentrations regardless of food intake and should be taken a minimum of 2 hours after or 6 hours before DTG
Anticonvulsants: Carbamazepine Phenobarbital Phenytoin	Dolutegravir	Avoid coadministration if possible. Alternative agents that do not interact with DTG include valproate, lamotrigine, levetiracetam, and topiramate. Remember that valproate is contra-indicated during pregnancy. Double DTG dose to 50 mg 12-hourly for carbamazepine if an alternative anticonvulsant cannot be used
Metformin/DTG	1 Metformin	DTG increases metformin levels. Maximum metformin dose 500 mg 12-hourly

GUIDE TO OFFERING PEP

HIV Post Exposure Prophylaxis

PEP is an emergency treatment

A person seeking PEP or exposed to HIV should be attended to immediately.

PEP must be offered to all persons that have been potentially exposed to HIV.

Make sure that you take the time to listen to the clients concerns and address these during your counselling.

When an individual reports exposure to HIV:

1. Confirm that exposure to HIV occurred within the past 72 hours

2. Explain to the client:

- PEP is ARV medication given to an HIV-negative person after exposure to HIV to prevent them from being infected with HIV.
- PEP should only be taken by HIV-negative individuals.
- It is most effective if taken as soon as possible after the exposure to HIV.
- Confirm that the client is agreeable to take the stat dose.

3. Administer the first PEP dose immediately

4. Conduct HIV (rapid) test

- Provide pre-test counselling:
- Administer the HIV test
- Provide the test result and post-test counselling
- If test result is HIV-positive refer for or initiate ART.
- If test result is HIV-negative.

PEP Drug	Regimen
Adults and children ≥10 years	*Children (<10 years)
If weight is ≥35kg: TDF 300mg + 3TC 300mg + DTG 50mg, once daily as TLD	If weight is <20kg: AZT/3TC twice daily + LPV/r twice daily
(add additional DTG 50mg, 12 hourly if on TB treatment or any other enzyme-inducing treatment)	If weight is ≥20kg: AZT/ 3TC twice daily + DTG 50mg, once daily

MOVE TO POINT 5 ON THE BACK OF THIS GUIDE TO CONFIRM THE EXPOSURE:

5. Confirm the exposure

In the last 72 hours did you:

- unknown?

If the client responds 'yes' to any of these questions, inform them that they may have been exposed to HIV and may benefit from PEP.

The type of exposure, HIV status of source persons and the material the person was exposed to, will determine the level of risk. Refer to the table below to assess the level of risk.

	LOW RISK (PEP MAY NOT BE REQUIRED)	HIGH RISK (PEP RECOMMENDED)
Type of exposure	Intact skin Human bites - no blood	Mucus membrane/non-intact skinPercutaneous injury
Source	HIV-negative	HIV-positive/status unknown; clinically well/unwell
Material	Saliva, tears, sweat, faeces, urine, sputum, vomit	 Semen, vaginal secretions, synovial, pleural, pericardial, peritoneal, amniotic fluids Blood and bloody bodily fluids; CSF, viral cultures in labs Breastmilk from an HIV-positive woman

6. Explain to the client what PEP is, the benefits of taking it, and how it needs to be taken

- they remember.
- headaches.

7. Provide the client with a prescription for collection of 28 days of PEP

Provide information about other tests and treatments that will be conducted:

Follow-up

- Inform that the require HIV tes 12 wee
- Explain client t for con repeat to mak they ar HIV-pos

8. Provide the date for the next visit

Use following questions to confirm the type of expose to assess their level of risk and eligibility to continue PEP.

a. have unprotected sex (sex with no condom or burst condom) with someone who is HIV-positive/whose HIV status is

b. have any contact with blood, semen, vaginal fluids (or other contaminated material)?

c. share needles when you injected drugs?

In the last 72 hours, did the child ingest breast milk from another mother who is HIV-positive/HIV status is unknown?

PEP is ARV treatment given to HIV-negative individuals after possible exposure to HIV, to prevent HIV infection.

PEP medication is taken daily for the full 28 days.

PEP works best if it is taken at the same time every day. If a dose is missed, the client must take it as soon as

PEP is safe, but some people may experience side effects, the most common being nausea, diarrhoea, and

- If there are side effects, the client should not stop taking PEP but should come back to the clinic.
- PEP can be taken during pregnancy and breastfeeding.

GUIDE TO

OFFERING PEP

- PEP is safe for pregnant women and will not hurt the unborn baby.
- Emphasize ongoing regular use of condoms while the client is on PEP.

After providing the above information check with the client that they want to continue taking PEP?

p for PEP	Other assessments
the client ey will	If a client was exposed to HIV through sexual contact the client may also require screening and testing for: Programmer + STIS + Henetitie B and C also needed if client was exposed to contaminated blood.
t at 4 and	 Clients with abrasions, cuts, or bites should be asked about their tetanus immunisation status,
ks.	and offer immunisation if appropriate.
to the	Ask the client about current contraceptive use and offer emergency contraception if needed.
he reason ducting a	Identify any other issues (especially mental health, substance abuse, sexual assault) that may face the client and provide the necessary, support, guidance and referral.
HIV test is e sure that	Conduct risk-reduction counselling and discuss with the client future HIV prevention options: Condom use PrEP
sitive.	Screen for TB and COVID.

HIV Post Exposure SHEET Prophylaxis (PEP)

What is PEP?

Post Exposure Prophylaxis or PEP is an emergency treatment that is given to a person exposed to HIV to prevent HIV.

- The sooner PEP is started after a possible exposure, the more effective it is.
- PEP is using ARV medication to prevent HIV.
- PEP must be started within 72 hours of possible exposure to HIV.
- PEP can only be taken by HIV-negative individuals.
- PEP is taken for 28 days after possible exposure to HIV to prevent an HIV infection.

Who should take PEP?

- Anyone who may have been exposed to HIV through contact with blood, body fluids, during sex or through their work.
- It's only recommended for people who are HIV negative or don't know their status.

Is PEP safe?

It is safe to take PEP to prevent you from getting HIV.

PEP can be taken when pregnant and breastfeeding, and will not hurt you or your baby.

How are ARVs used differently for HIV prevention and treatment?

ARVs can be used to prevent HIV:

- PrEP: When ARVs are taken before someone is exposed to HIV to protect them from HIV it is called Pre-Exposure Prophylaxis (PrEP).
- **PEP:** When ARVs are taken within 72 hours after exposure to HIV to prevent HIV it is called PEP.
- ARVs can be used as treatment:
- ART: ARV are used to treat HIV-positive people to reduce the levels of HIV in the body, this is called ART.

1. 2. 3. 4. 5. 6. 7.

Getting started on PEP:

- 1. Visit your clinic as soon as possible if you had unprotected sex or came into contact or other body fluids.
- 2. Tell the clinic staff that you need to be seen to immediately.
- 3. PEP can only be given to you if you were exposed to HIV in the past 72 hours.
- 4. If you report within 72 hours you will be given your first dose of PEP.
- 5. You will be tested for HIV to check that you are HIV negative.
- 6. If you test HIV negative the nurse will check if you require PEP.
- 7. The nurse will give you a prescription for PEP for 28 days.

If you test positive, the nurse will start you on treatment.

FACT

SHEET

How to take PEP:

- PEP must be taken for 28 days.
- Try to take PEP at the same time every day.
- If you miss a dose, take the next dose as soon as you remember.
- Do not take a double dose.
- Continue to use of condoms while you are on PEP.
- Some people that take PEP may feel nauseous or have diarrhoea or headaches.
- If you do experience any of these do not stop taking PEP, visit the clinic for further help.

When do you need to come back to the clinic?

- You will return after 4 weeks and again in 12 weeks for an HIV test or any other tests that may be needed.
- The clinic will give an appointment for when you need to return.
- These tests are important to make sure that the PEP has worked and that you have not become HIV-positive.
- If you require help or more information, visit your clinic.

Protect yourself from HIV

If you are worried that you may be exposed to HIV again talk to the nurse about taking PrEP and using condoms.

Exposure to HIV is a medical emergency

ALL health facilities should provide PEP

ALL HIV exposures should be considered for PEP

PEP should be started as soon as possible after exposure

The STAT PEP dose should be administered immediately
